

Welcome

Thank you for choosing Freenove products!

About Battery

First, read the document [About Battery.pdf](#) in the unzipped folder.

If you did not download the zip file, please download it and unzip it via link below.

https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/archive/master.zip

Get Support & Customer Service

You may find somethings missing or broken, or some difficulty to learn the kit.

Freenove provides free and quick support, including but not limited to:

- Quality problems of products
- Problems in using products
- Questions for learning and technology
- Opinions and suggestions
- Ideas and thoughts

If you have any concerns, please send email to us:

support@freenove.com

And suggestions and feedbacks are welcomed. Many customers offered great feedbacks. According to that, we are keeping updating the kit and the tutorial to make it better. Thank you.

Safety

Pay attention to safety when using and storing this product:

- Do not expose children under 6 years of age to this product. Put it out of their reach.
- Children lack safety ability should use this product under the guardianship of adults.
- This product contains small and sharp parts. Do not swallow, prick and scratch to avoid injury.
- This product contains conductive parts. Do not hold them to touch power supply and other circuits.
- Some parts will rotate or move when it works. Do not touch them to avoid being bruised or scratched.
- The wrong operation may cause overheat. Do not touch and disconnect the power supply immediately.
- Operate in accordance with the requirements of the tutorial. Otherwise, the parts may be damaged.
- Store the product in a dry place and avoid direct sunlight.
- Turn off the power of the circuit before leaving.

About

Freenove provides open source electronic products and services.

Freenove is committed to helping customers learn programming and electronic knowledge, quickly realize their creative ideas and product prototypes and launching innovative products. Our services include:

- Kits of robots, smart cars and drones
- Kits for learning Arduino, Raspberry Pi and micro:bit
- Electronic components and modules, tools
- **Product customization service**

You can learn more about us or get our latest information through our website:

Transmission Parts

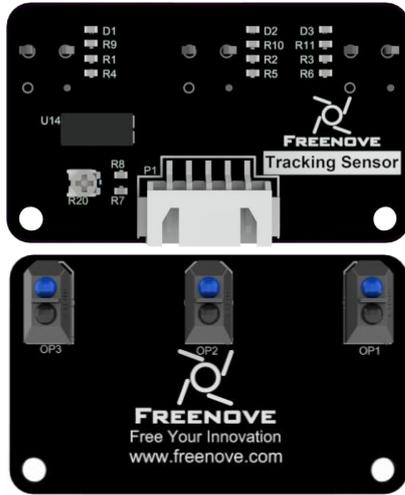

<p>Servo package x2</p>  A blue servo motor with a long metal horn and various mounting hardware including screws and brackets.	<p>Driven wheel x4</p>  A black rubber tire mounted on a yellow plastic wheel hub.
<p>DC speed reduction motor x4</p>  A yellow rectangular DC motor with a grey output shaft.	<p>Motor bracket package x4</p>  A grey metal bracket with four mounting holes and four screws of different lengths.

Acrylic Parts

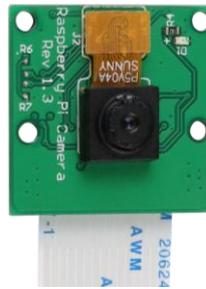

Electronic Parts

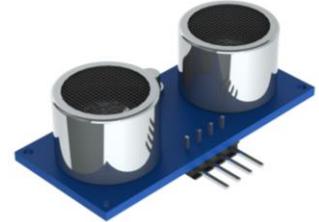

Line tracking module x1

Camera x1

HC-SR04 Ultrasonic Module x1

Connection board

Jumper Wire F/F(4) x1

XH-2.54-5Pin cable x1

Tools

Cross screwdriver (3mm) x1

Black tape x1

Cable Tidy x25cm

Self-prepared Parts

2X 3.7V 18650 lithium **rechargeable** batteries with continuous discharge current $>3a$.
It is easier to find proper battery on **eBay** than Amazon. Search "18650 high drain" on eBay.

Raspberry Pi (Recommended model: Raspberry 4B / 3B+ / 3B) x1

Preface

Welcome to use Freenove 4WD Smart Car Kit for Raspberry Pi. By using this tutorial, you can make a very cool smart car with many functions.

This kit is based on the popular control panel Pi Raspberry, so you can share and exchange your experience and design ideas with many enthusiasts all over the world. The parts in this kit include all electronic components, modules, and mechanical components required for making the smart car. And all of them are packaged individually. There are detailed assembly and commissioning instructions in this book.

And if you encounter any problems, please feel free to contact us for fast and free technical support.

support@freenove.com

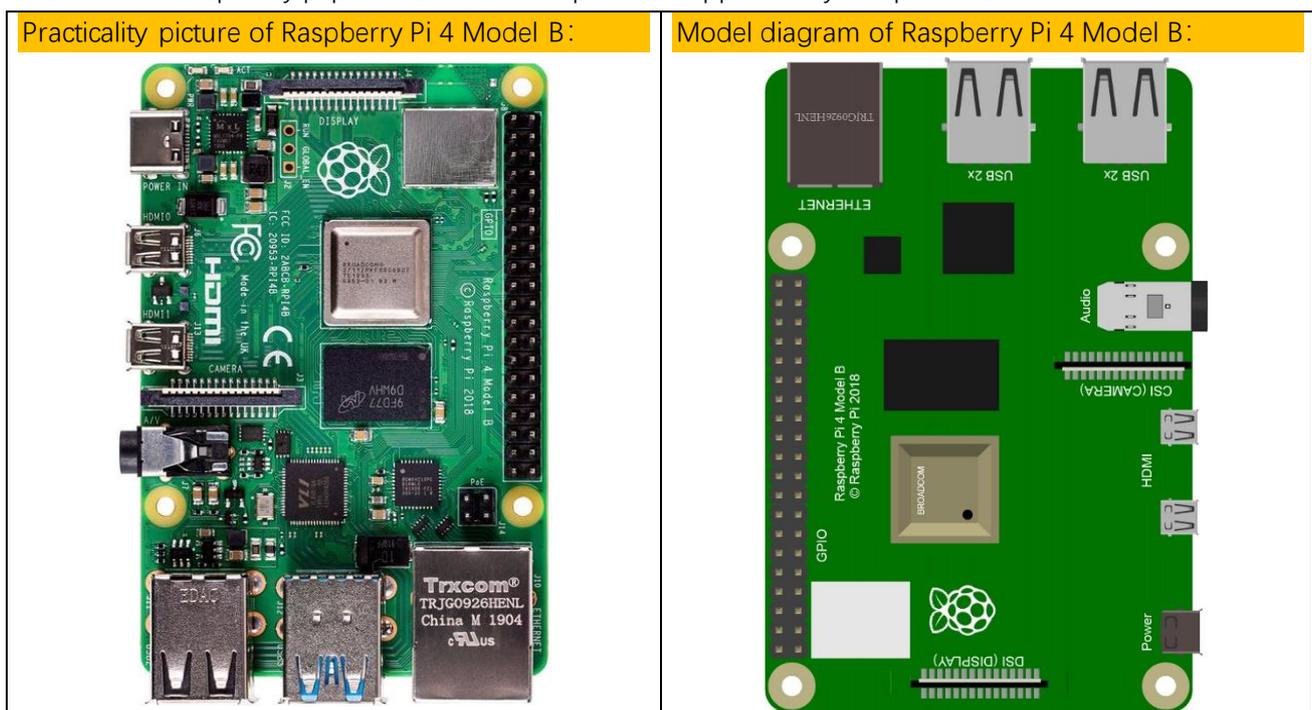

The contents in this book can ensure enthusiastic with little technical knowledge to make the smart car. If you are very interested in Raspberry Pi, and want to learn how to program and build the circuit, please visit our website www.freenove.com or contact us to buy the kits designed for beginners:
Freenove Basic\LCD1602\Super\Ultrasonic\RFID\Ultimate Starter Kit for Raspberry Pi

Raspberry Pi Introduction

Raspberry Pi (called RPi, RPI, RasPi, the text these words will be used alternately later), a micro-computer with size of a card, quickly swept the world since its debut. It is widely used in desktop workstation, media center, smart home, robots, and even the servers, etc. It can do almost anything, which continues to attract fans to explore it. Raspberry Pi used to be running with Linux system and along with the release of windows 10 IoT. We can also run it with Windows. Raspberry Pi (with interfaces USB, network, HDMI, camera, audio, display and GPIO), as a microcomputer, can be running in command line mode and desktop system mode. Additionally, it is easy to operate just like Arduino, and you can even directly operate the GPIO of CPU.

So far, Raspberry Pi has developed to the fourth generation. Changes in versions are accompanied by increase and upgrades in hardware. A type and B type, the first generation of products, have been stopped due to various reasons. Other versions are popular and active and the most important is that they are consistent in the order and number of pins, which makes the compatibility of peripheral devices greatly enhanced between different versions.

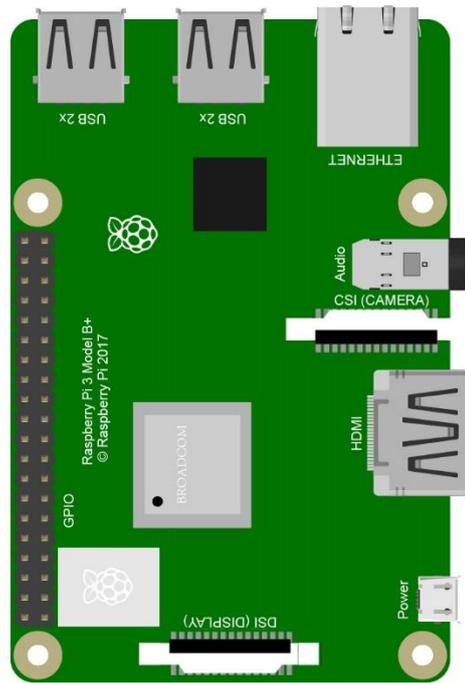

Below are the raspberry pi pictures and model pictures supported by this product.

Practicality picture of Raspberry Pi 3 Model B+:

Hardware interface diagram of RPi 3A+/A+ is shown below:

Hardware interface diagram of RPi Zero/Zero W is shown below:

GPIO

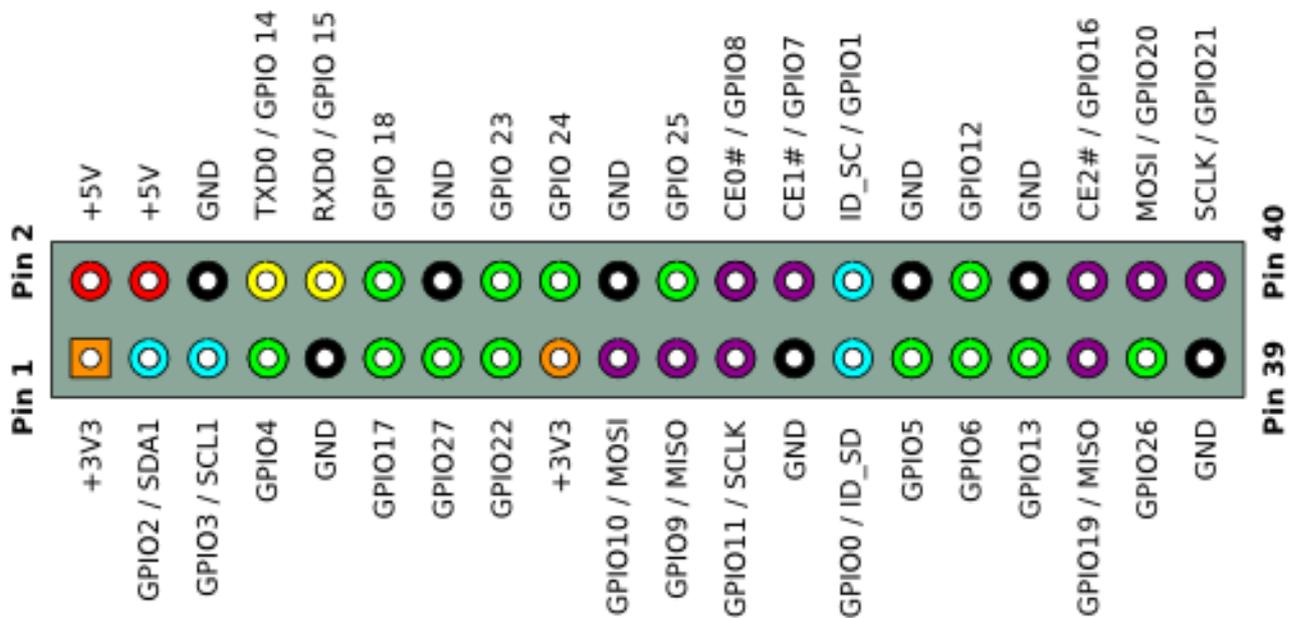

GPIO: General purpose input/output. We will introduce the specific feature of the pins on the Raspberry Pi and what you can do with them. You can use them for all sorts of purposes. Most of them can be used as either inputs or outputs, depending on your program.

When programming the GPIO pins there are 3 different ways to refer to them: GPIO numbering, physical numbering, WiringPi GPIO Numbering.

BCM GPIO Numbering

Raspberry Pi CPU use BCM2835/BCM2836/BCM2837 of Broadcom. GPIO pin number is set by chip manufacturer. These are the GPIO pins as that computer recognizes. The numbers are unordered and don't make any sense to humans. You will need a printed reference or a reference board that fits over the pins.

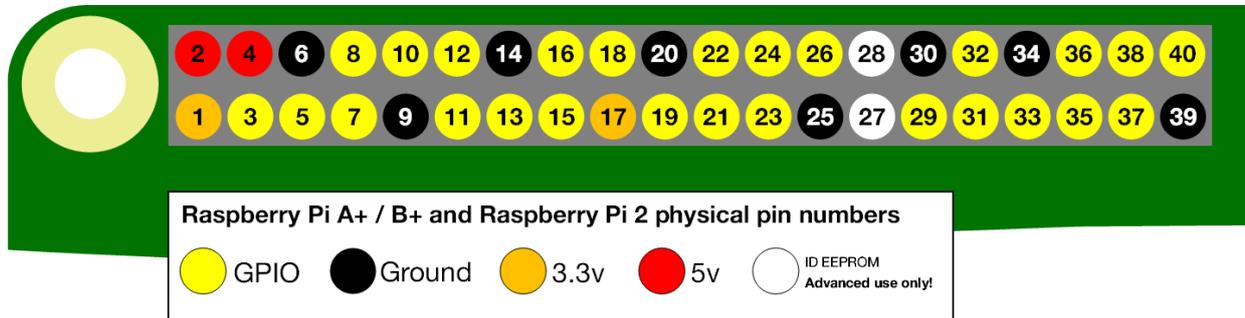

Each pin is defined as below:

For more details about pin definition of GPIO, please refer to <http://pinout.xyz/>

PHYSICAL Numbering

Another way to refer to the pins is by simply counting across and down from pin 1 at the top left (nearest to the SD card). This is 'physical numbering', as shown below:

WiringPi GPIO Numbering

Different from the previous mentioned two kinds of GPIO serial numbers, RPi GPIO serial number of the WiringPi was renumbered. Here we have three kinds of GPIO number mode: based on the number of BCM chip, based on the physical sequence number and based on wiringPi. The correspondence between these three GPIO numbers is shown below:

wiringPi Pin	BCM GPIO	Name	Header	Name	BCM GPIO	wiringPi Pin		
—	—	3.3v	1 2	5v	—	—	For Pi B	
8	R1:0/R2:2	SDA	3 4	5v	—	—		
9	R1:1/R2:3	SCL	5 6	0v	—	—		
7	4	GPIO7	7 8	TxD	14	15		
—	—	0v	9 10	RxD	15	16		
0	17	GPIO0	11 12	GPIO1	18	1		
2	R1:21/R2:27	GPIO2	13 14	0v	—	—		
3	22	GPIO3	15 16	GPIO4	23	4		
—	—	3.3v	17 18	GPIO5	24	5		
12	10	MOSI	19 20	0v	—	—		
13	9	MISO	21 22	GPIO6	25	6		
14	11	SCLK	23 24	CE0	8	10		
—	—	0v	25 26	CE1	7	11		
30	0	SDA.0	27 28	SCL.0	1	31		For A+, B+, 2B, 3B, 3B+, 4B, Zero
21	5	GPIO.21	29 30	0V	—	—		
22	6	GPIO.22	31 32	GPIO.26	12	26		
23	13	GPIO.23	33 34	0V	—	—		
24	19	GPIO.24	35 36	GPIO.27	16	27		
25	26	GPIO.25	37 38	GPIO.28	20	28		
—	—	0V	39 40	GPIO.29	21	29		
—	—	—	—	—	—	—		
wiringPi Pin	BCM GPIO	Name	Header	Name	BCM GPIO	wiringPi Pin		

(For more details, please refer to <https://projects.drogon.net/raspberry-pi/wiringpi/pins/>)

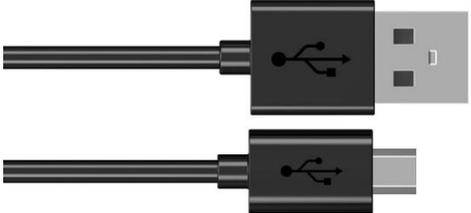

Chapter 0 Raspberry Pi Preparation

Install the System

Firstly, install a system for your RPi.

Component List

Required Components

<p>Raspberry Pi 4B / 3B+ / 3B / 3A+ (Recommended)</p> 	<p>5V/3A Power Adapter. Different versions of Raspberry Pi have different power requirements.</p> 
<p>Micro USB Cable x1</p> 	<p>Micro SD Card (TF Card) x1, Card Reader x1</p> 

This robot also supports the following versions of the Raspberry Pi, but **additional accessories** need to be prepared by yourself.

Raspberry	Additional accessories
Raspberry Pi Zero W	Camera cable(>25cm) for zero w, 15 Pin 1.0mm Pitch to 22 Pin 0.5mm https://www.amazon.com/dp/B076Q595HJ/
Raspberry Pi Zero 1.3	wireless network adapter, zero Camera cable for zero w, >25cm
Raspberry Pi 2 Model B	wireless network adapter, OTG cable (USB Type micro B to USB Type A)
Raspberry Pi 1 Model A+	wireless network adapter, OTG cable (USB Type micro B to USB Type A)
Raspberry Pi 1 Model B+	wireless network adapter, OTG cable (USB Type micro B to USB Type A)

Power requirement of different versions of Raspberry Pi is shown in following table:

Product	Recommended PSU current capacity	Maximum total USB peripheral current draw	Typical bare-board active current consumption
Raspberry Pi Model A	700mA	500mA	200mA
Raspberry Pi Model B	1.2A	500mA	500mA
Raspberry Pi Model A+	700mA	500mA	180mA
Raspberry Pi Model B+	1.8A	600mA/1.2A (switchable)	330mA
Raspberry Pi 2 Model B	1.8A	600mA/1.2A (switchable)	350mA
Raspberry Pi 3 Model B	2.5A	1.2A	400mA
Raspberry Pi 3 Model A+	2.5A	Limited by PSU, board, and connector ratings only.	350mA
Raspberry Pi 3 Model B+	2.5A	1.2A	500mA
Raspberry Pi 4 Model B	3.0A	1.2A	600mA
Raspberry Pi Zero W	1.2A	Limited by PSU, board, and connector ratings only.	150mA
Raspberry Pi Zero	1.2A	Limited by PSU, board, and connector ratings only	100mA

For more details, please refer to <https://www.raspberrypi.org/help/faqs/#powerReqs>

In addition, RPi also needs a network cable used to connect it to wide area network.

All of these components are necessary. Among them, the power supply is required at least 5V/2.5A, because lack of power supply will lead to many abnormal problems, even damage to your RPi. So power supply with 5V/2.5A is highly recommend. SD Card Micro (recommended capacity 16GB or more) is a hard drive for RPi, which is used to store the system and personal files. In later projects, the components list with a RPi will contains these required components, using only RPi as a representative rather than presenting details.

Optional Components

Under normal circumstances, there are two ways to login to Raspberry Pi: using independent monitor, or remote desktop to share a monitor with your PC.

Required Accessories for Monitor

If you want to use independent monitor, mouse and keyboard, you also need the following accessories.

1. Display with HDMI interface
2. Mouse and Keyboard with USB interface

As to Pi Zero and Pi Zero W, you also need the following accessories.

1. Mini-HDMI to HDMI converter wire.
2. Micro-USB to USB-A Receptacles converter wire (Micro USB OTG wire).
3. USB HUB.
4. USB transferring to Ethernet interface or USB Wi-Fi receiver.

For different Raspberry Pi, the optional items are slightly different. But all of their aims are to convert the special interface to standard interface of standard Raspberry Pi.

Item	Pi Zero	Pi Zero W	Pi A+	Pi 3A+	Pi B+/2B	Pi 3B/3B+/4B
Monitor	Yes	Yes	Yes	Yes	Yes	Yes
Mouse	Yes	Yes	Yes	Yes	Yes	Yes
Keyboard	Yes	Yes	Yes	Yes	Yes	Yes
Mini-HDMI to HDMI cable	Yes	Yes	No	No	No	No
Micro-USB to USB-A OTG cable	Yes	Yes	No	No	No	No
USB HUB	Yes	Yes	Yes	Yes	No	No
USB transferring to Ethernet interface	select one from two or	optional	select one from two or	optional	Internal Integration	Internal Integration
USB Wi-Fi receiver	select two from two	Internal Integration	select two from two	Internal Integration	optional	

Required Accessories for Remote Desktop

If you don't have an independent monitor, or you want to use a remote desktop, first you need to login to Raspberry Pi through SSH, then open the VNC or RDP service. So you need the following accessories.

Item	Pi Zero	Pi Zero W	Pi A+	Pi 3A+	Pi B+/2B	Pi 3B/3B+/4B
Micro-USB to USB-A OTG cable	Yes	Yes	No			
USB transferring to Ethernet interface	Yes	Yes	Yes			

Raspbian System

Official Method

It is recommended to use this method.

You can follow the official method to install the system for raspberry pi

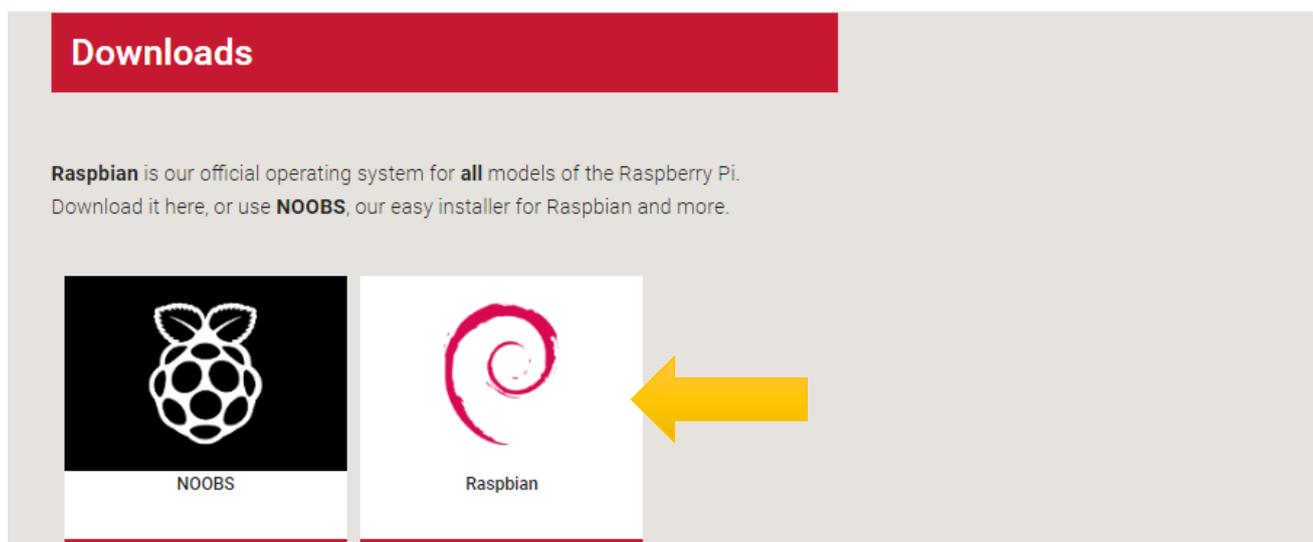

<https://projects.raspberrypi.org/en/projects/raspberry-pi-setting-up/2>

In this way, the system will be download **automatically** via the application.

Download system manually (optional)

After installing the Imagage Tool in **link above**. You can also download the system **manually** first.

Visit RPi official website (<https://www.Raspberrypi.org/>), click “Downloads” and choose to download “RASPBIAN”. RASPBIAN supported by RPi is an operating system based on Linux, which contains a number of contents required for RPi. We recommended RASPBIAN system to beginners. All projects in this tutorial are operated under the RASPBIAN system.

<https://www.raspberrypi.org/downloads/raspbian/>

The screenshot shows the Raspbian download page with three main sections:

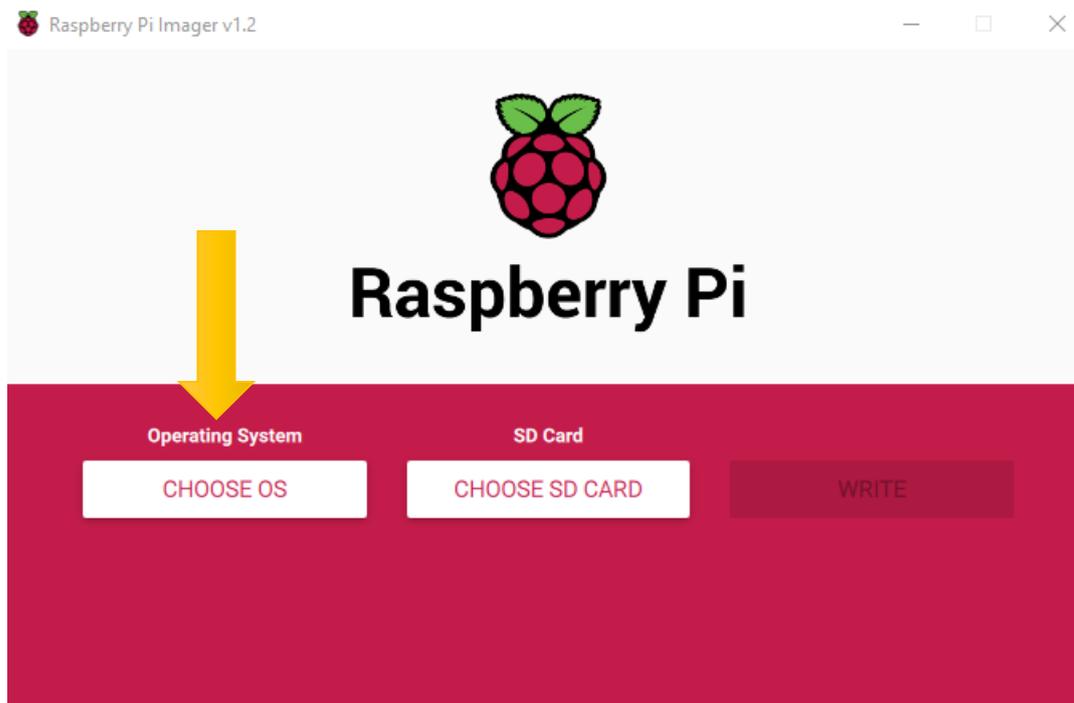

- Raspbian Buster with desktop and recommended software**: Image with desktop and recommended software based on Debian Buster. Version: June 2019, Release date: 2019-06-20, Kernel version: 4.19, Size: 1945 MB. Includes 'Download Torrent' and 'Download ZIP' buttons.
- Raspbian Buster with desktop**: Image with desktop based on Debian Buster. Version: June 2019, Release date: 2019-06-20, Kernel version: 4.19, Size: 1149 MB. Includes 'Download Torrent' and 'Download ZIP' buttons.
- Raspbian Buster Lite**: Minimal image based on Debian Buster. Version: June 2019, Release date: 2019-06-20, Kernel version: 4.19, Size: 426 MB. Includes 'Download Torrent' and 'Download ZIP' buttons.

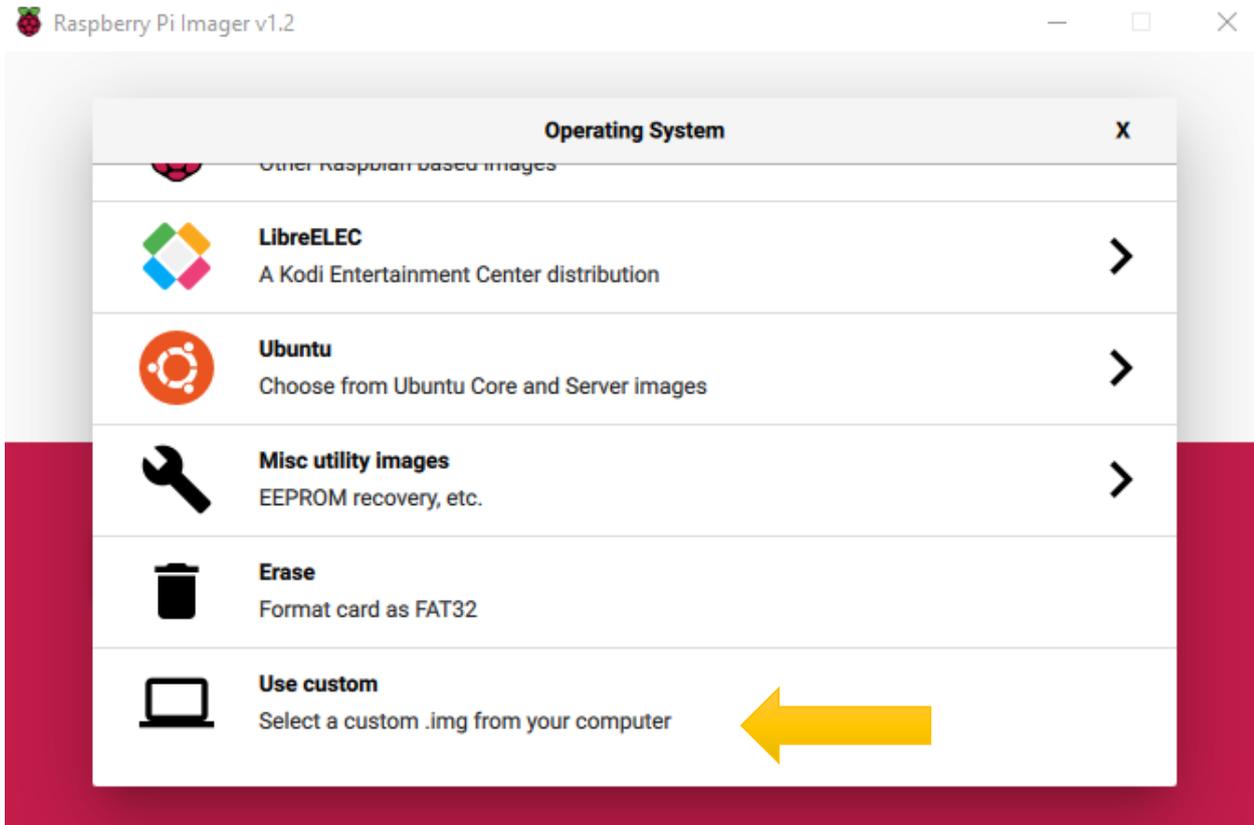

SHA-256 hashes are provided for each image. A yellow arrow points to the 'Download ZIP' button for the first option.

After the zip file is download.

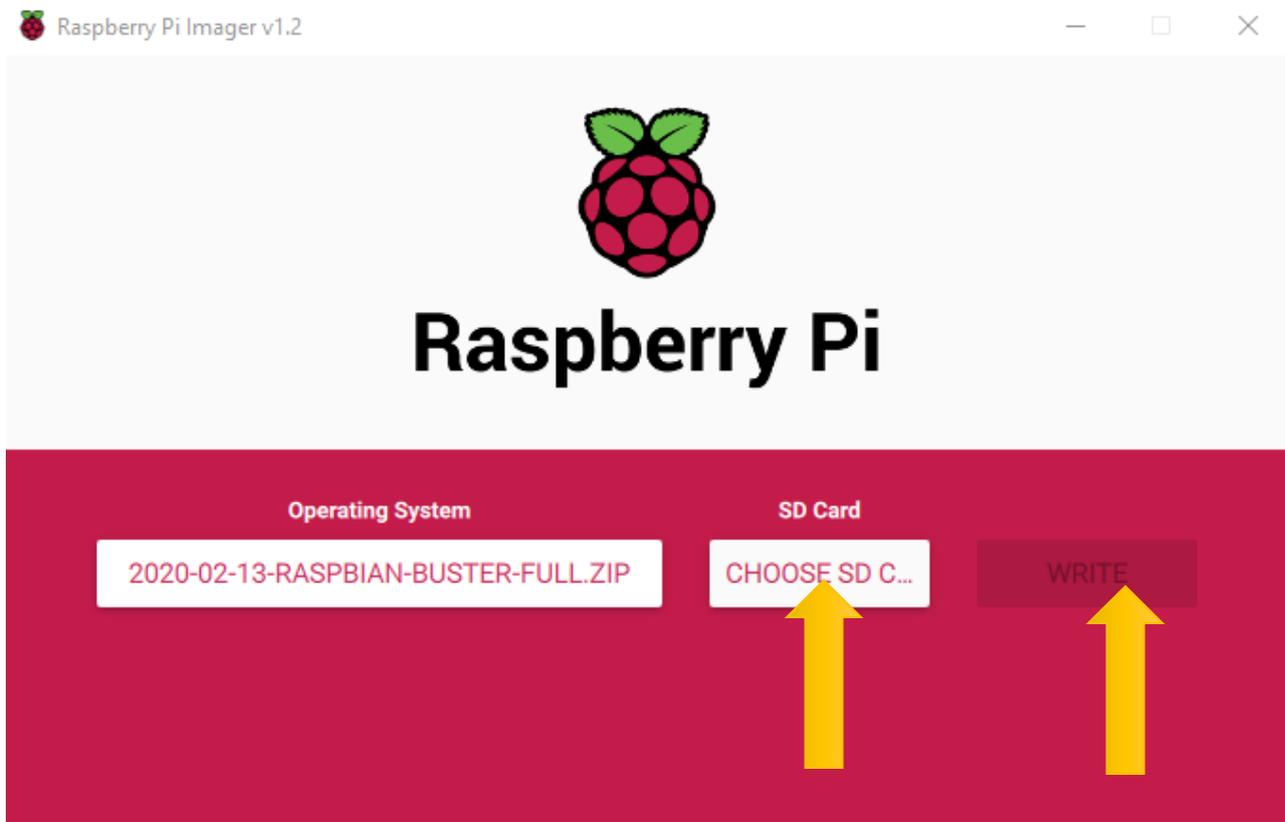

Write System to Micro SD Card

First, put your Micro **SD card** into card reader and connect it to USB port of PC. Then open imager toll, choose Choose system that you just download in Use custom.

Choose the SD card. Then click "WRITE".

Start Raspberry Pi

If you don't have a spare monitor, please jumper to next section. If you have a spare monitor, please follow steps in this section.

After the system is written successfully, take out Micro SD Card and put it into the card slot of RPi. Then connect RPi to screen through the HDMI, to mouse and keyboard through the USB port, to network cable through the network card interface and to the power supply. Then your RPi starts initially. Later, you need to enter the user name and password to login. The default user name: pi; password: raspberry. Enter and login. After login, you can enter the following interface.

Now, you have successfully installed the RASPBIAN operating system for your RPi. Then you can connect WiFi on the right corner.

Now you can jumper to [VNC Viewer](#).

Remote desktop & VNC

If you don't have a spare display, mouse and keyboard for your RPi, you can use a remote desktop to share a display, keyboard, and mouse with your PC. Below is how to use remote desktop under the Windows operating system to control RPi.

Under windows, Raspberry Pi can be generally accessed remotely through two applications. The first one is the windows built-in application remote desktop, which corresponds to the Raspberry Pi xrdp service. The second one is the free application VNC Viewer, which corresponds to the VNC interface of Raspberry Pi. Each way has its own advantages. You can choose either one or two.

Windows	Raspberry Pi
Remote Desktop Connection	Xrdp
VNC Viewer	VNC

VNC Viewer can not only run under Windows, but also under system MAC, Linux, IOS, Android and so on.

Some remote connection tools like Xrdp, it does not support opencv and pyqt window display. So it is recommended to use VNC Viewer to connect Raspberry Pi for this robot.

SSH

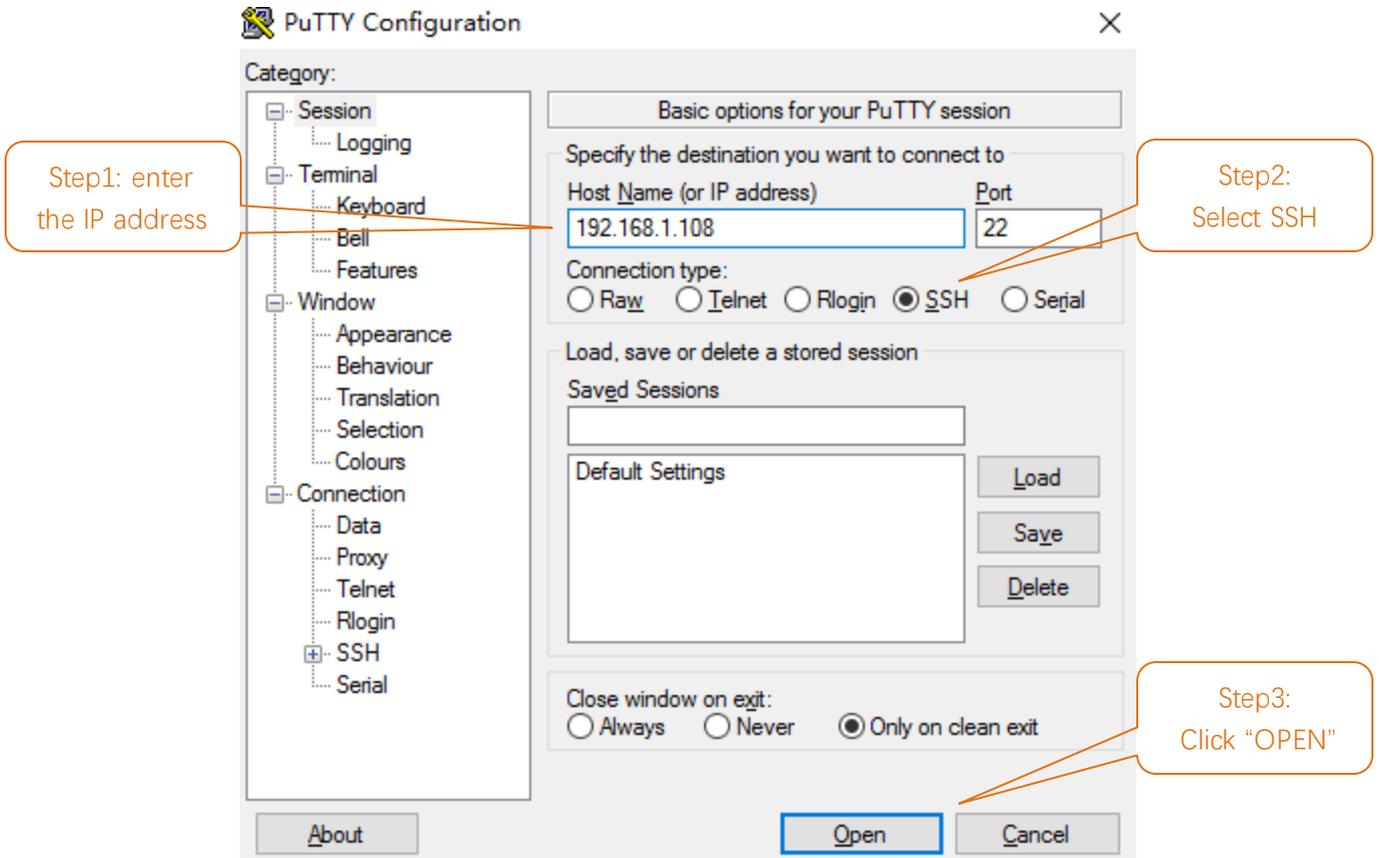

Under previous Raspbian system, SSH is opened by default. Under the latest version of Raspbian system, it is closed by default. So you need to open it first.

Method: after the system is written. Create a folder named "ssh" under generated boot disk, then the SSH connection will be opened.

And then, download the tool software Putty. Its official address: <http://www.putty.org/>

Or download it here: <http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>

Then use cable to connect your RPi to the routers of your PC LAN, to ensure your PC and your RPi in the same LAN. Then put the system Micro SD Card prepared before into the slot of the RPi and turn on the power supply waiting for starting RPi. Later, enter control terminal of the router to inquiry IP address named "raspberrypi". For example, I have inquired to my RPi IP address, and it is "192.168.1.108". Then open Putty, enter the address, select SSH, and then click "OPEN", as shown below:

There will appear a security warning at first login. Just click "YES".

PuTTY Security Alert

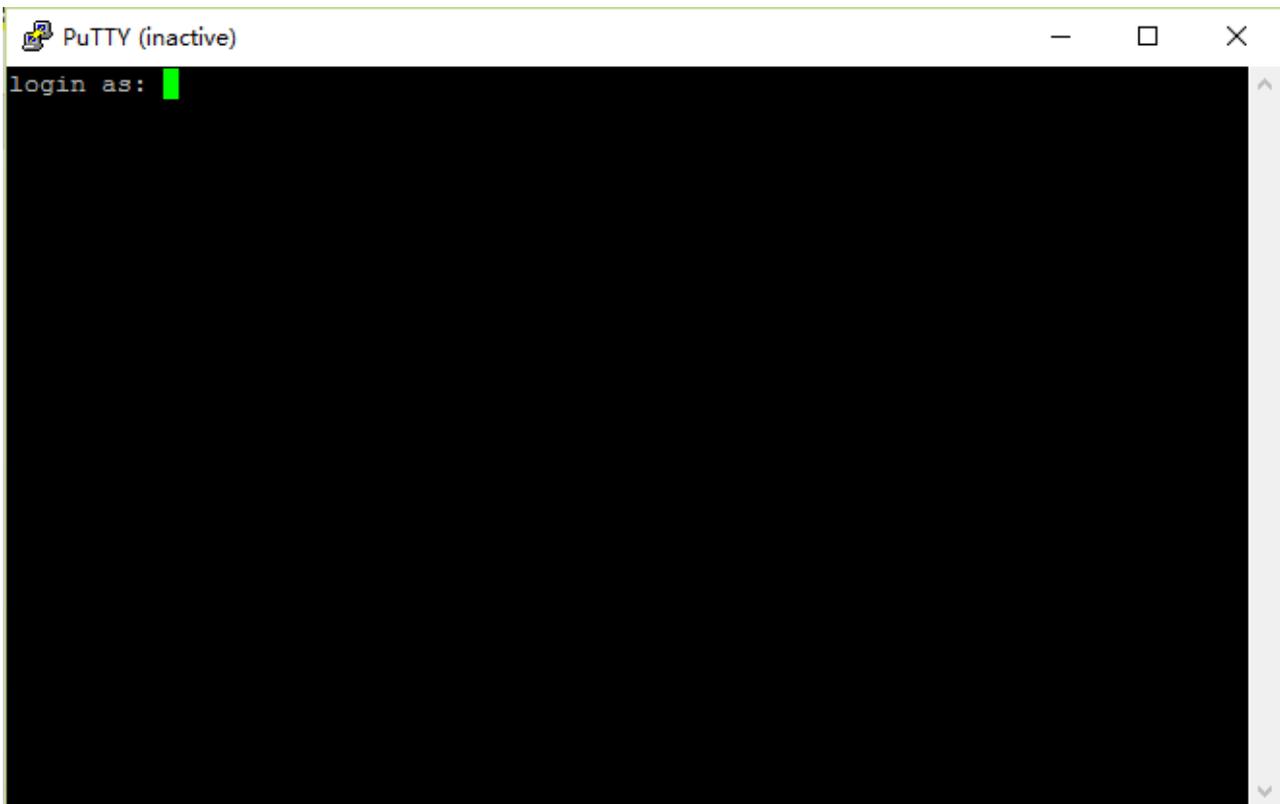

WARNING - POTENTIAL SECURITY BREACH!

The server's host key does not match the one PuTTY has cached in the registry. This means that either the server administrator has changed the host key, or you have actually connected to another computer pretending to be the server.

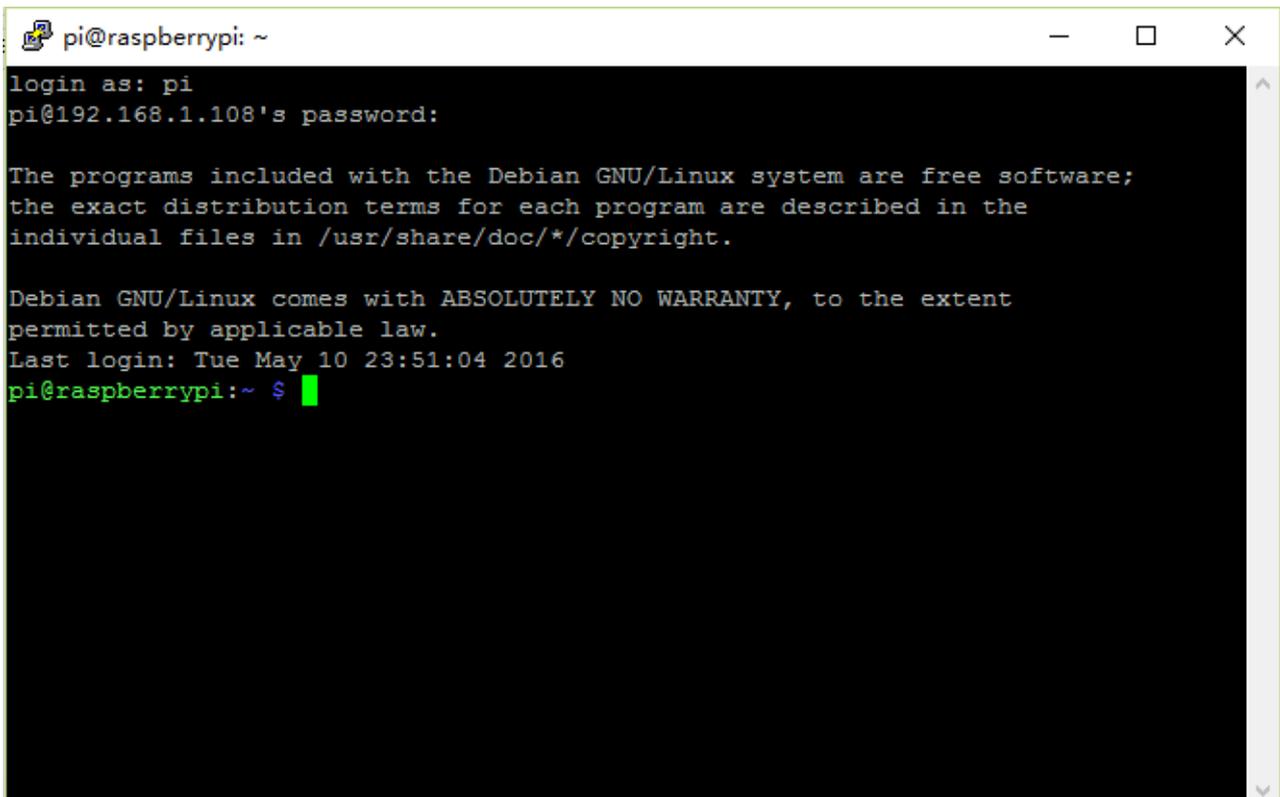

The new rsa2 key fingerprint is:
ssh-rsa 2048 7a:e1:50:ba:dc:01:87:1b:a5:f9:d2:d4:12:d6:fe:ab

If you were expecting this change and trust the new key, hit Yes to update PuTTY's cache and continue connecting. If you want to carry on connecting but without updating the cache, hit No. If you want to abandon the connection completely, hit Cancel. Hitting Cancel is the ONLY guaranteed safe choice.

Then there will be a login interface (RPi default user name: **pi**; the password: **raspberrypi**). When you enter the password, there will be **no display** on the screen. This is normal. After the correct input, press “Enter” to confirm.

Then enter the command line of RPi, which means that you have successfully login to RPi command line mode.

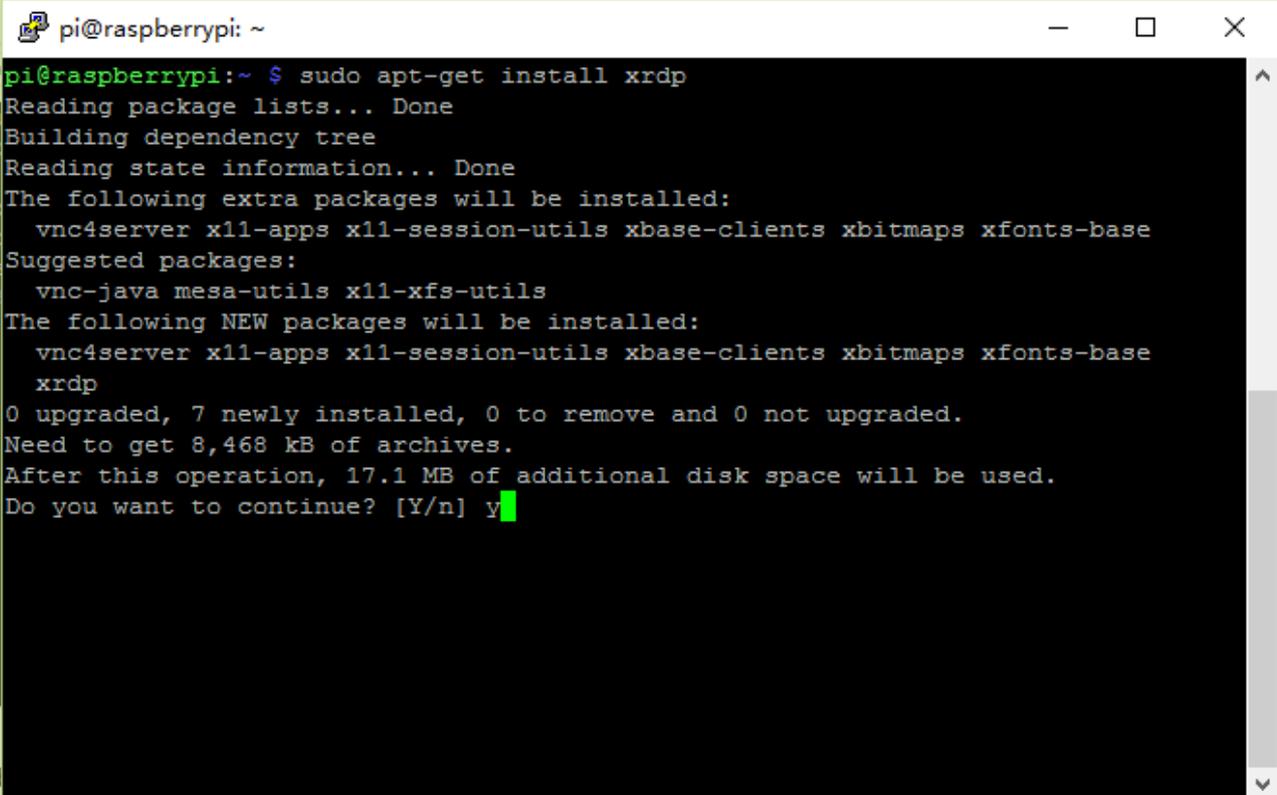

Remote Desktop Connection & xrdp

If you want to use built-in Remote Desktop Connection under Windows, you need install xrdp service on Raspberry Pi.

Next, install a xrdp service, an open source remote desktop protocol(xrdp) server, for RPi. Type the following command, then press enter to confirm:

```
sudo apt-get install xrdp
```

Later, the installation starts.

A terminal window titled 'pi@raspberrypi: ~' showing the execution of the command 'sudo apt-get install xrdp'. The output displays the package lists, dependency tree, and the list of packages to be installed, including xrdp and several extra packages like vnc4server and x11-apps. The user confirms the installation by typing 'y' at the prompt 'Do you want to continue? [Y/n] y'.

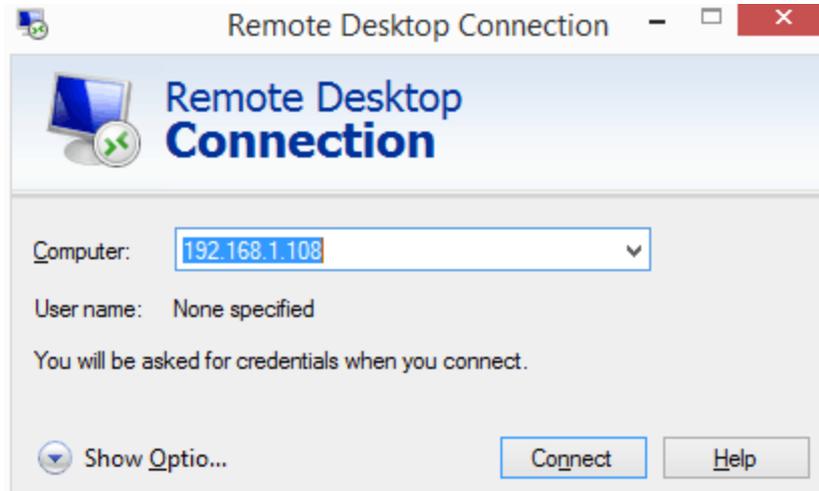

```
pi@raspberrypi:~ $ sudo apt-get install xrdp
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following extra packages will be installed:
  vnc4server x11-apps x11-session-utils xbase-clients xbitmaps xfonts-base
Suggested packages:
  vnc-java mesa-utils x11-xfs-utils
The following NEW packages will be installed:
  vnc4server x11-apps x11-session-utils xbase-clients xbitmaps xfonts-base
  xrdp
0 upgraded, 7 newly installed, 0 to remove and 0 not upgraded.
Need to get 8,468 kB of archives.
After this operation, 17.1 MB of additional disk space will be used.
Do you want to continue? [Y/n] y
```

Enter "Y", press key "Enter" to confirm.

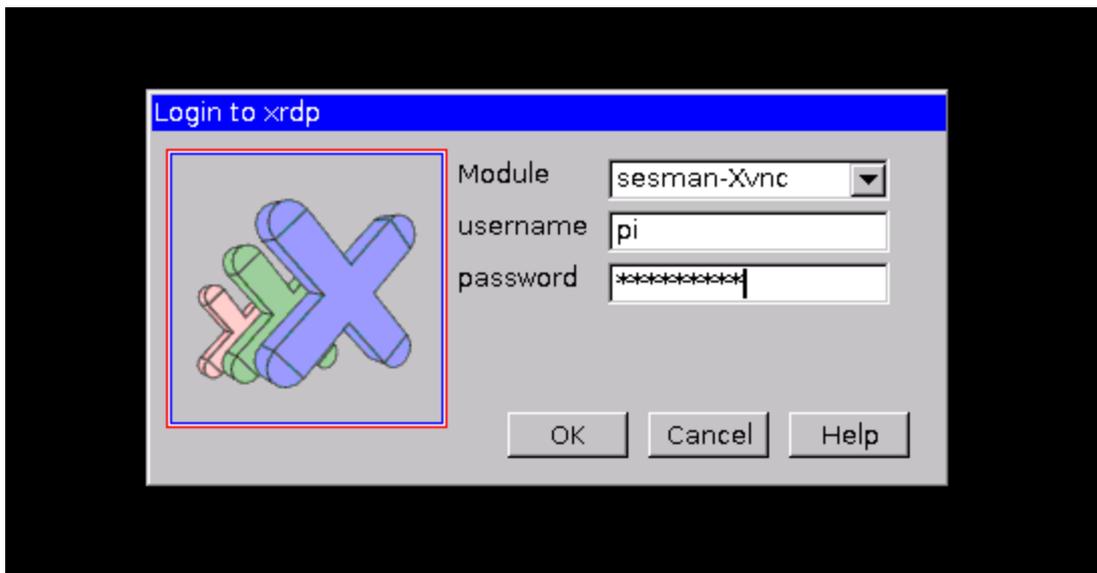

After the installation is completed, you can use Windows remote desktop applications to login to your RPi.

Login to Windows remote desktop

Use "WIN+R" or search function, open the remote desktop application "mstsc.exe" under Windows, enter the IP address of RPi and then click "Connect".

Later, there will be xrdp login screen. Enter the user name and password of RPi (RPi default user name: pi; password: raspberry) and click "OK".

Later, you can enter the RPi desktop system.

Here, you have successfully used the remote desktop login to RPi.

VNC Viewer & VNC

Type the following command. And select 5 Interfacing Options → P3 VNC → Yes → OK → Finish. Here Raspberry Pi may need be restarted, and choose ok. Then open VNC interface.

```
sudo raspi-config
```

```
Raspberry Pi Software Configuration Tool (raspi-config)

1 Change User Password          Change password for the current u
2 Network Options              Configure network settings
3 Boot Options                 Configure options for start-up
4 Localisation Options         Set up language and regional sett
5 Interfacing Options          Configure connections to peripher
6 Overclock                   Configure overclocking for your P
7 Advanced Options            Configure advanced settings
8 Update                      Update this tool to the latest ve
9 About raspi-config          Information about this configurat

                                <Select>                                <Finish>
```

```
Raspberry Pi Software Configuration Tool (raspi-config)

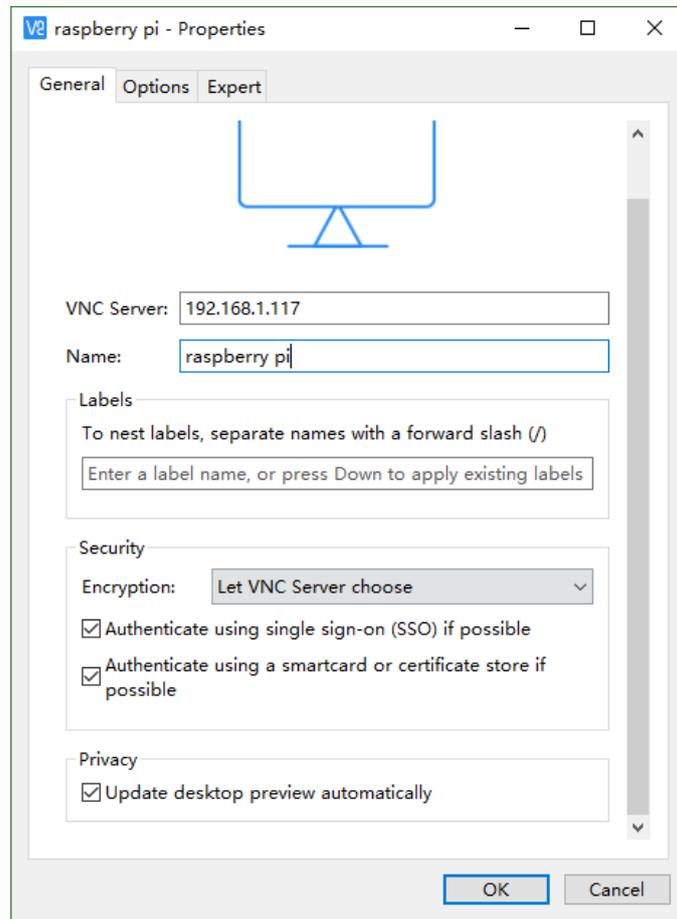

P1 Camera                      Enable/Disable connection to the
P2 SSH                         Enable/Disable remote command lin
P3 VNC                         Enable/Disable graphical remote a
P4 SPI                         Enable/Disable automatic loading
P5 I2C                         Enable/Disable automatic loading
P6 Serial                      Enable/Disable shell and kernel m
P7 1-Wire                     Enable/Disable one-wire interface
P8 Remote GPIO                 Enable/Disable remote access to G

                                <Select>                                <Back>
```

Then download and install VNC Viewer by click following link:

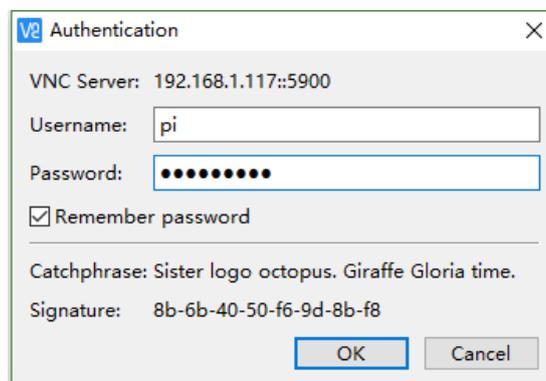

<https://www.realvnc.com/en/connect/download/viewer/windows/>

After installation is completed, open VNC Viewer. And click File → New Connection. Then the interface is shown below.

Enter ip address of your Raspberry Pi and fill in a Name. And click OK.

Then on the VNC Viewer panel, double-click new connection you just created, and the following dialog box pops up.

Enter username: **pi** and Password: **raspberry**. And click OK.

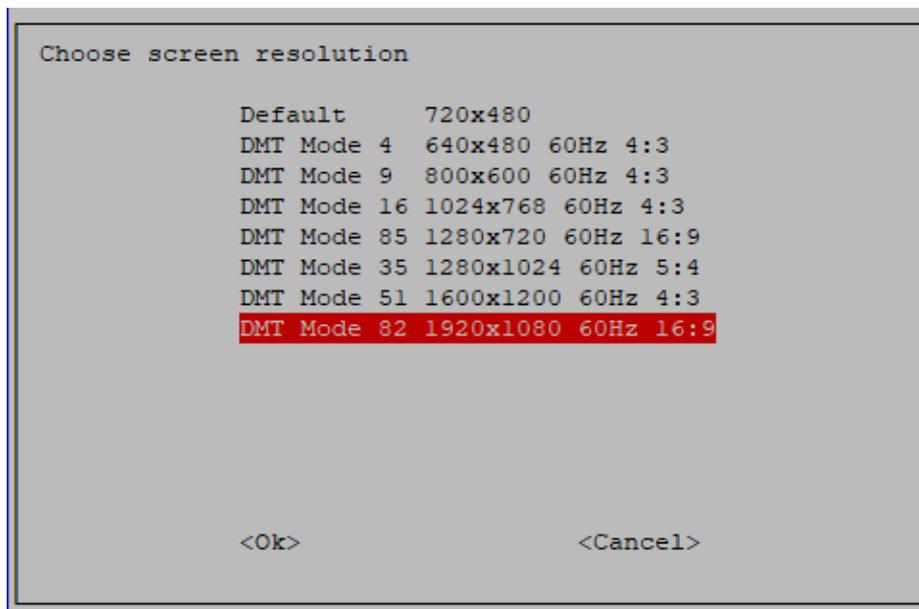

Here, you have logged in to Raspberry Pi successfully by using VNC Viewer

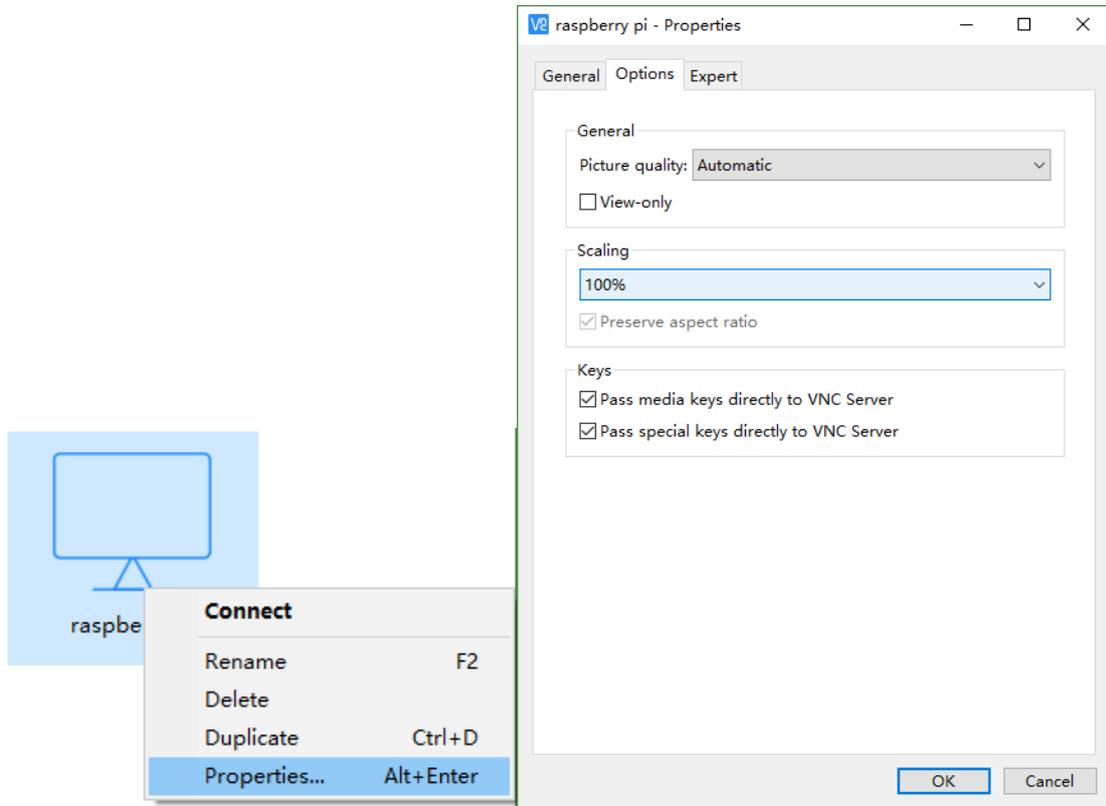

If the resolution ratio is not great or there is just a **black little window**, you can set a proper resolution ratio via steps below.

```
sudo raspi-config
```

Select 7 Advanced Options → A5 Resolution → proper resolution ratio (set by yourself) → OK → Finish. And then reboot Raspberry Pi.

In addition, your VNC Viewer window may zoom your Raspberry Pi desktop. You can change it. On your VNC View control panel, click right key. And select Properties ->Options label->Scaling. Then set proper scaling.

Here, you have logged in to Raspberry Pi successfully by using VNC Viewer and operated proper setting.

Wi-Fi

Raspberry Pi 4B/3B+/3B integrates a Wi-Fi adaptor. You can use it to connect to your Wi-Fi. Then you can use the wireless remote desktop to control your RPi. This will be helpful for the following work. Raspberry Pi of other models can use wireless remote desktop through accessing an external USB wireless card.

Chapter 1 Assemble Smart Car

If you have any concerns, please feel free to contact us via support@freenove.com

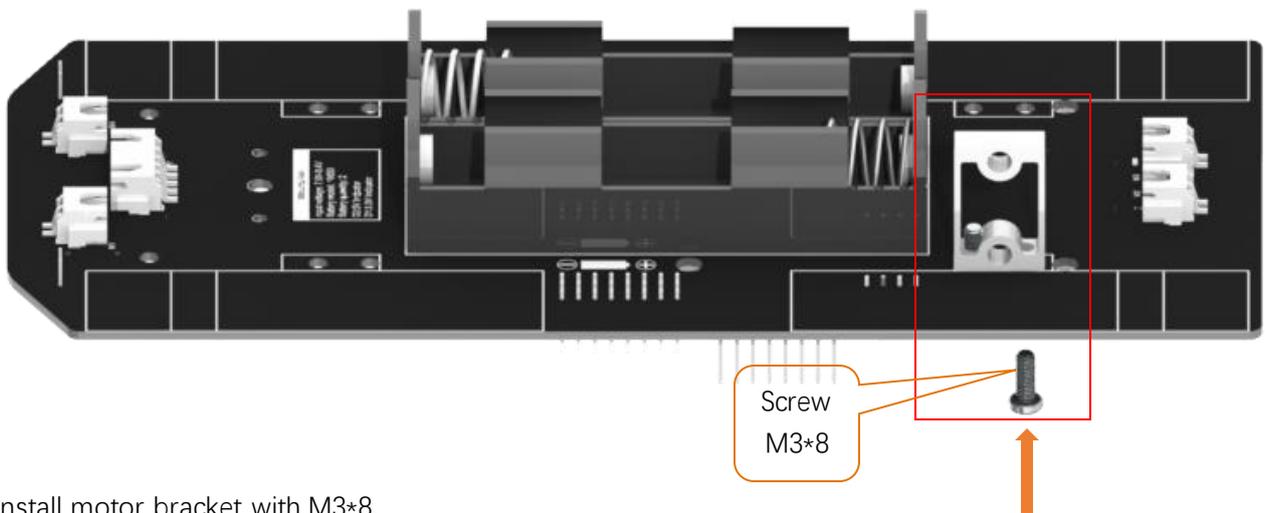

Motor and wheel

There is a special fixed bracket to fix motor, which contains an aluminum bracket, two M3*30 screws, two M3*8 screws, and two M3 nuts, as shown below:

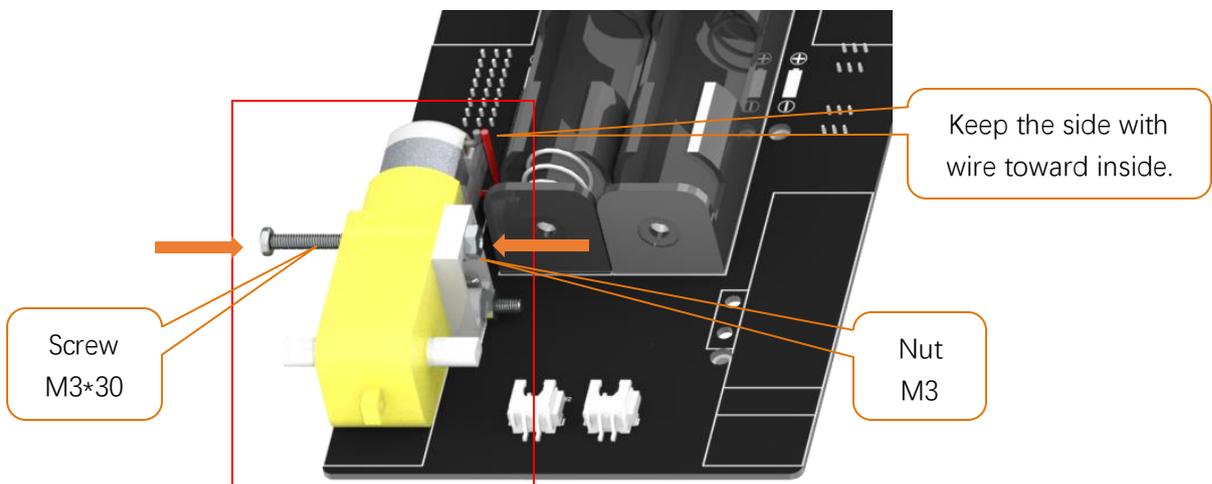

Installation steps:

Step 1

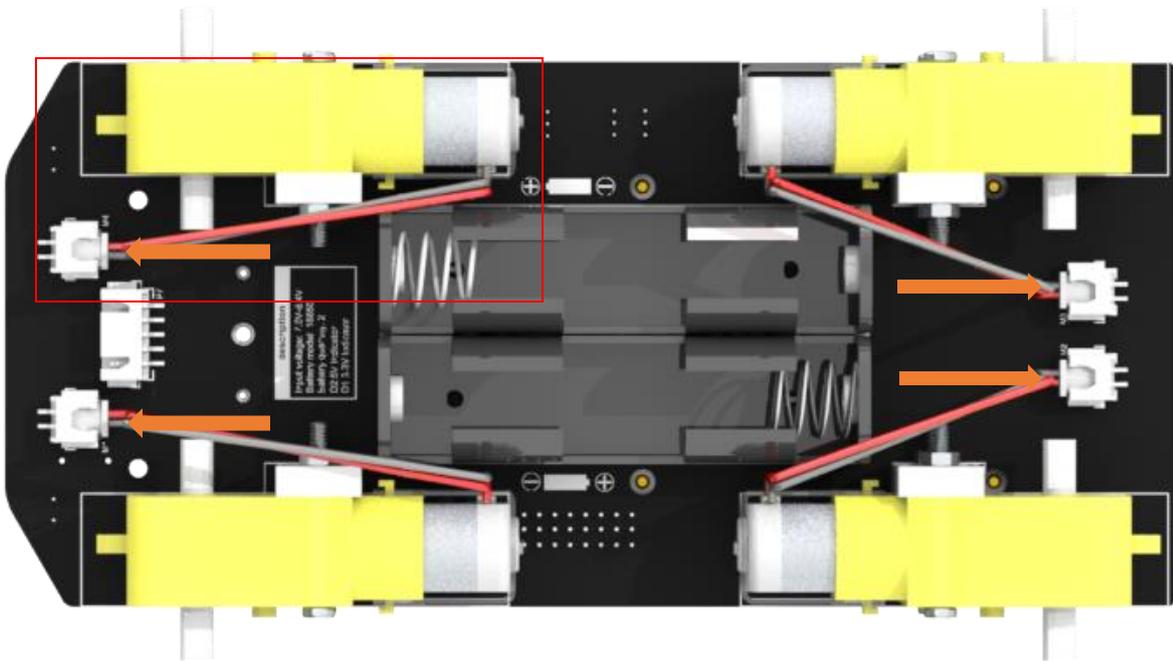

Install motor bracket with M3*8.

Step 2

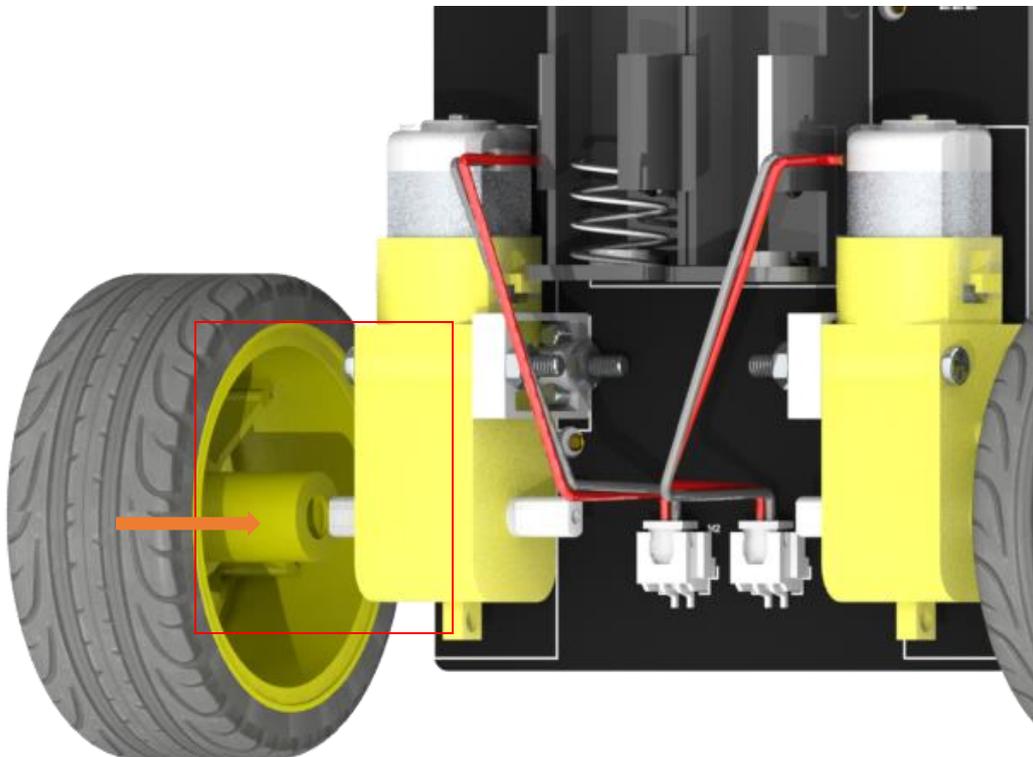

Install motor to motor bracket with screw M3*30 and Nut M3.

Step 3

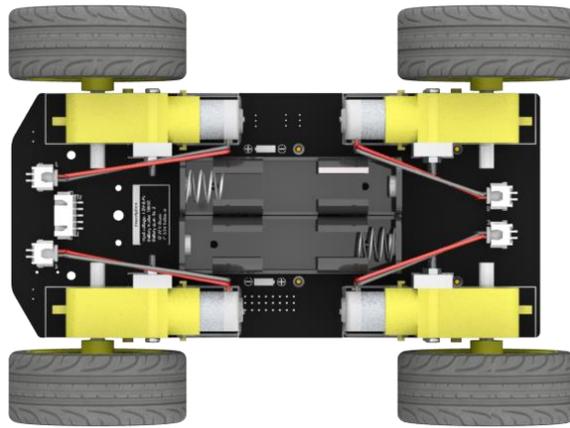

The installation of rest 3 sets of motor is the same. Then connect motor wire to motor port. If you think the wires are too long, you can tie a knot.

Step 4

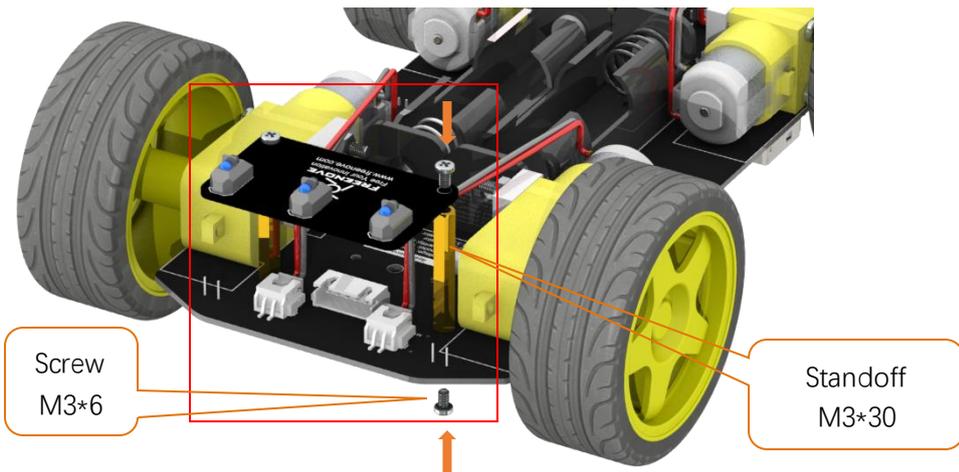

Install 4 wheels to motor. The mounting hole is not a round hole

Now, all motors and wheels are installed successful.

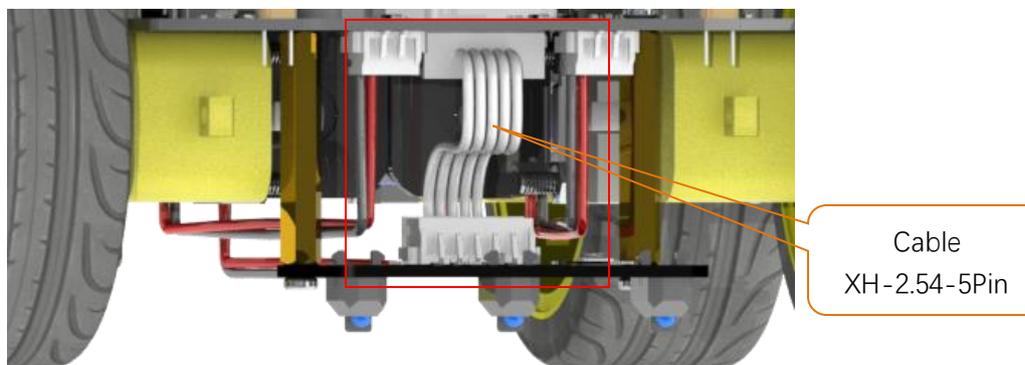

Infrared line tracking module

Step 1

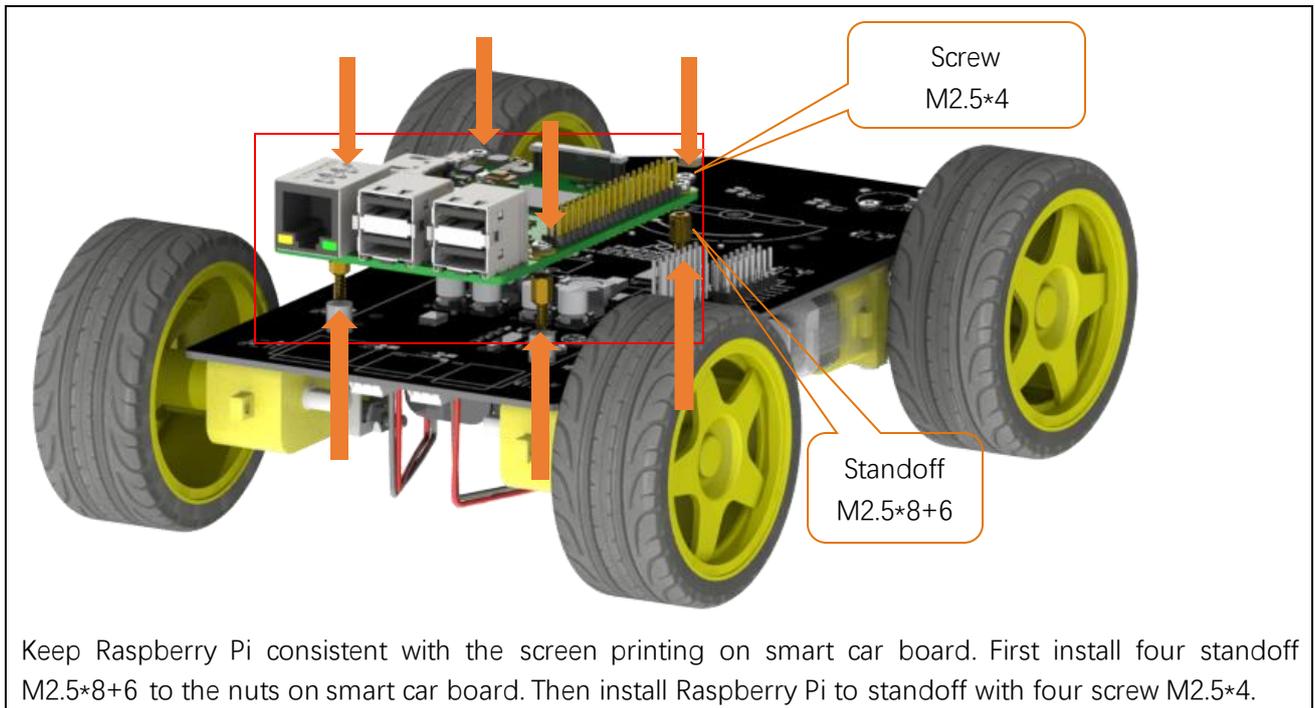

First install two standoff M3*30 on smart car board with screw M3*6. Then install Line tracking module on standoff with screw M3*6.

Step 2

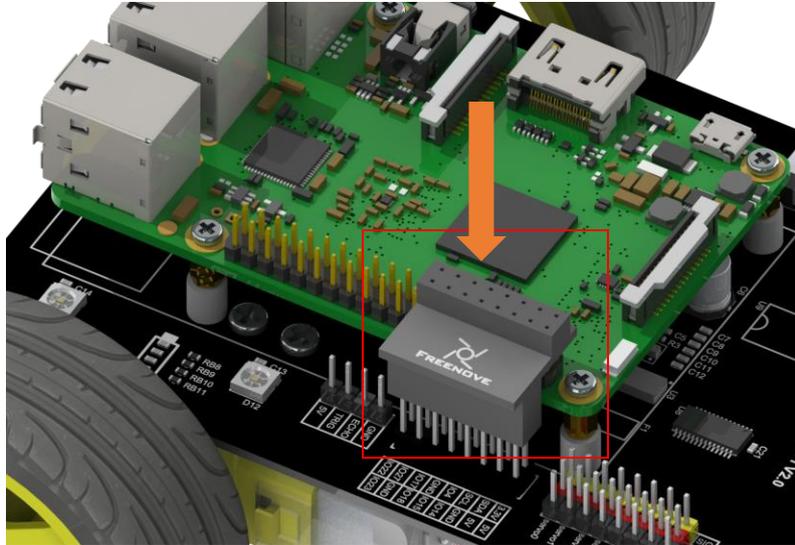

Connect Line tracking module to smart car board with XH-2.54-5Pin cable.

Raspberry Pi

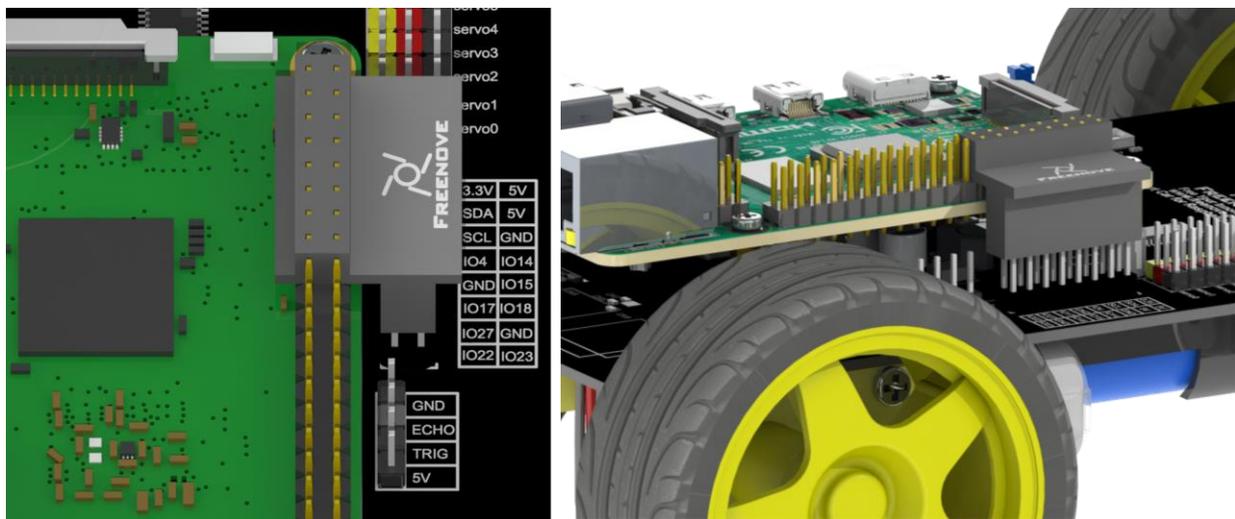

Connection board

Step 1

Install the connection board as shown in the figure above. Long female header connector should be connected to smart car board and short one should be connected to raspberry Pi.

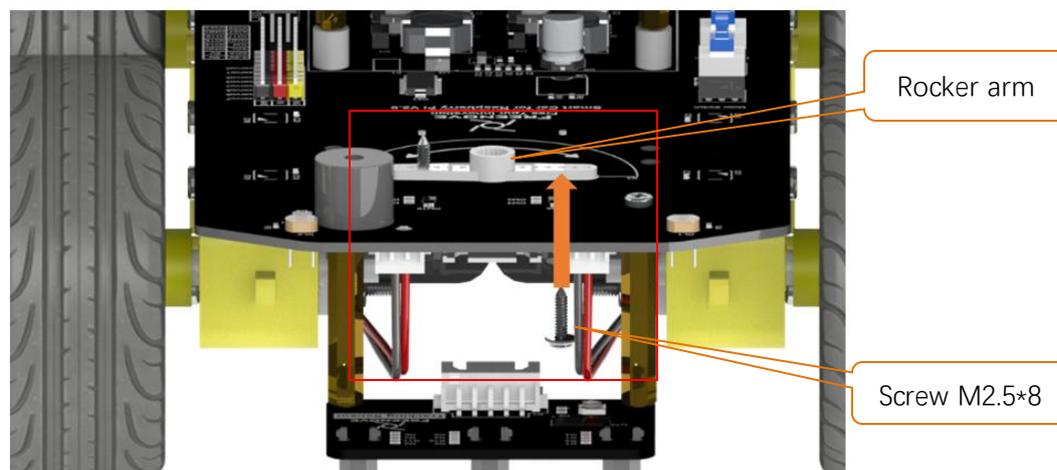

Step 2

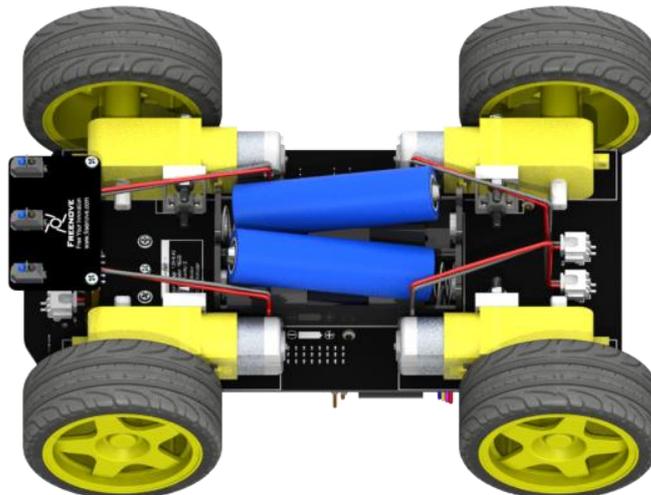

Press connection board hard to its limited position.

Pan Tilt

There are two servo packages. Each package contains one servo, three rocker arms, one M2*4 screw and two M2.5*8 screws, as shown below:

Keep the Rocker arm consistent with screen printing on smart car board. Use two screw M2.5*8 to install it with smart car board.

Finally, install two 18650 batteries. 2X 3.7V 18650 lithium **rechargeable** batteries without protection board. **It is easier to find proper battery on eBay than Amazon.**

Don't assemble servos at present. The assembly about Pan Tilt will be introduced in next chapter. Just follow the tutorial step by step.

Chapter 2 Software installation and Test (necessary)

If you have any concerns, please feel free to contact us via support@freenove.com

In this chapter, we will do some necessary preparation work: start your Pi Raspberry and install some necessary libraries. Then test some parts.

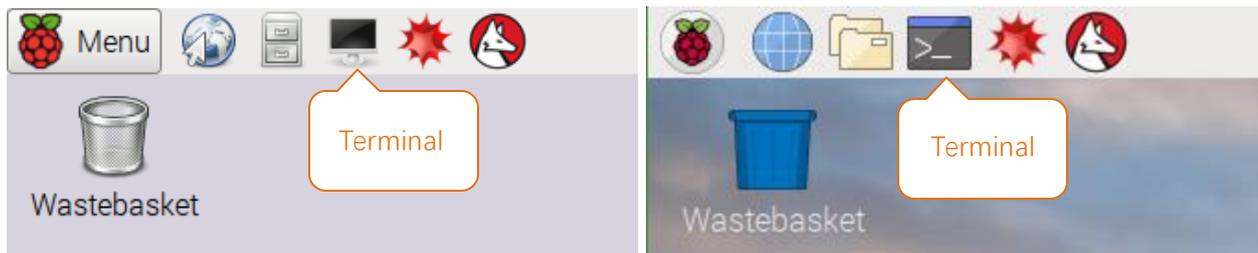

Note:

The installation of libraries needs much time. **You can power Raspberry Pi with a power supply Cable.** Batteries are needed when driving peripherals such as motors, servos, LEDs, etc.

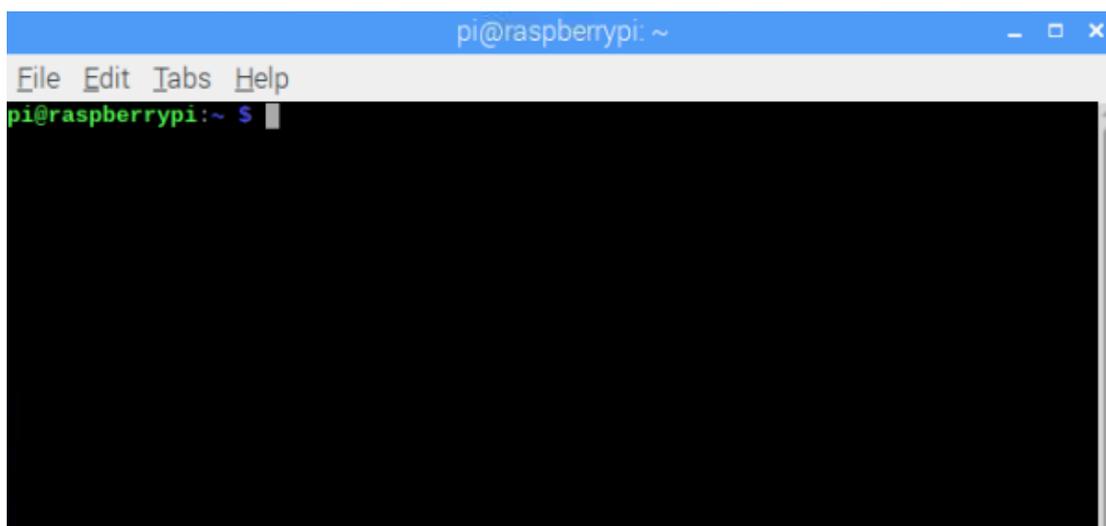

If you are using **remote desktop mode** to login Raspberry Pi, you need use [VNC viewer](#).

Step 1 Obtain the Code

To download the code, you can power Raspberry Pi with a power supply cable **or** switch on S1 (Power Switch). Then open the Raspberry Pi and the terminal. You can open the terminal by clicking as shown below, or you can press "CTAL + ALT + T" on the desktop.

The terminal is shown below:

Open the terminal and type the following commands to obtain the car code. And the code will be placed in the directory "Pi". (Note: Here are two commands. Please execute commands in order.)

```
cd ~
git clone https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi.git
```

```
pi@raspberrypi:~ $ cd ~
pi@raspberrypi:~ $ git clone https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi.git
```

Downloading need much time. Please wait with patience.

You can also find and download the code by visiting our official website (<http://www.freenove.com>) or our GitHub repository (<https://github.com/freenove>).

Please note that this tutorial is based on python3. If you want to use python2, please download another version of the tutorial.

Set Python3 as default python (necessary)

First, execute python to check default python on your raspberry Pi. Press Ctrl-Z to exit.

```
pi@raspberrypi:~ $ python
```

If it is python3, you can skip this section.

If it is python2, you need execute following commands to set default python to python3.

1. Enter directory /usr/bin

```
cd /usr/bin
```

2. Delete the old python link.

```
sudo rm python
```

3. Create new python links to python.

```
sudo ln -s python3 python
```

4. Check python. Press Ctrl-Z to exit.

```
python
```

```
pi@raspberrypi:/usr/bin $ sudo rm python
pi@raspberrypi:/usr/bin $ sudo ln -s python3 python
pi@raspberrypi:/usr/bin $ python
Python 3.5.3 (default, Jan 19 2017, 14:11:04)
[GCC 6.3.0 20170124] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

If you want to set python2 as default python in **other projects**.

Just repeat command above and change python3 to python2.

Shortcut Key

Now, we will introduce several shortcuts that are very **useful** and **commonly used** in terminal.

1. **up and down arrow keys**. History commands can be quickly brought back by using up and down arrow keys, which are very useful when you need to reuse certain commands.

When you need to type command, pressing “↑” will bring back the previous command, and pressing “↓” will bring back the latter command.

2. **Tab key**. The Tab key can automatically complete the command/path you want to type. When there are multiple commands/paths conforming to the already typed letter, pressing Tab key once won't have any result. And pressing Tab key again will list all the eligible options. This command/path will be directly completed when there is only one eligible option.

As shown below, under the '~' directory, enter the Documents directory with the “cd” command. After typing “cd D”, press Tab key, then there is no response. Press Tab key again, then all the files/folders that begin with “D” is listed. Continue to type the character “oc”, then press the Tab key, and then “Documents” is completed automatically.

```
pi@raspberrypi:~ $ cd D
Desktop/  Documents/ Downloads/
pi@raspberrypi:~ $ cd Doc
```

```
pi@raspberrypi:~ $ cd D
Desktop/  Documents/ Downloads/
pi@raspberrypi:~ $ cd Documents/
```

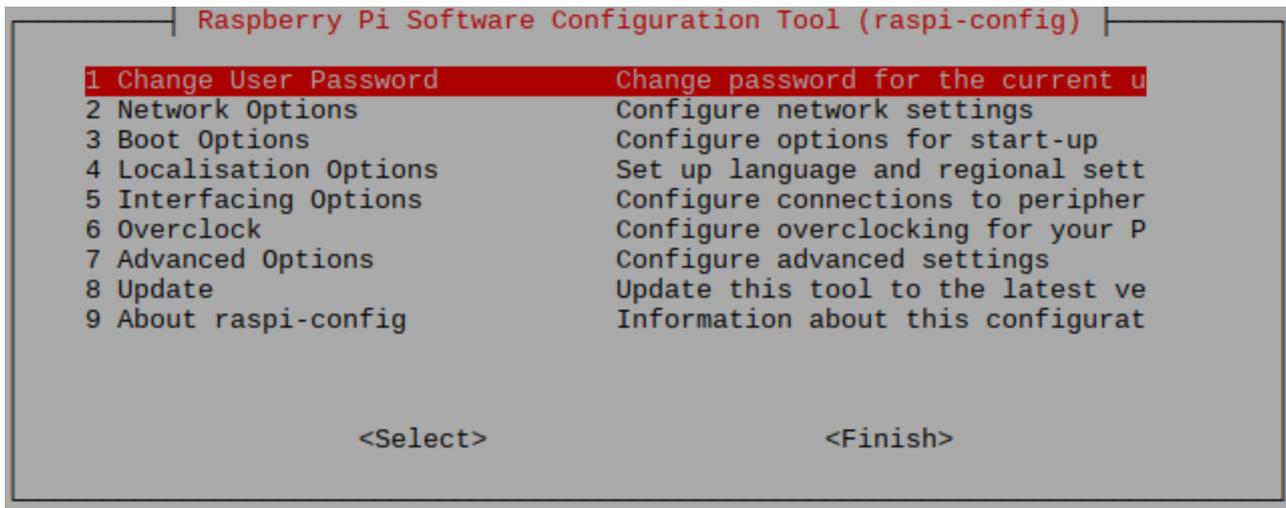

Step 2 Configure I2C

Enable I2C

The I2C interface raspberry pi is closed in default. You need to open it manually. You can enable the I2C interface in the following way. Open the terminal. Type command in the terminal:

```
sudo raspi-config
```

Then open the following dialog box:

Choose “5 Interfacing Options” → “P5 I2C” → “Yes” → “Finish” in order and restart your RPi later. Then the I2C module starts.

Type a command to check whether the I2C module is enabled:

```
lsmod | grep i2c
```

If I2C module has been enabled, following content will be shown (the number of your device may be different):

```
pi@raspberrypi:~$ lsmod | grep i2c
i2c_bcm2708          4770  0
i2c_dev             5859  0
pi@raspberrypi:~$
```

Install I2C-Tools

Type the command to install I2C-Tools.

```
sudo apt-get install i2c-tools
```

Install python-smbus

Python-smbus is a module of the program Python, which contains some classes and methods to operate I2C.

Type the following command to install python-smbus:

```
sudo apt-get install python3-smbus
```

Communication test

The smart car board has two chips, PCF8591 and PCA9685. Their I2C addresses are 0X48 and 0X40 respectively. Command “i2cdetect -y 1” can detect if the board is successfully connected to Raspberry Pi.

```
i2cdetect -y 1
```

```
pi@raspberrypi:~ $ i2cdetect -y 1
   0  1  2  3  4  5  6  7  8  9  a  b  c  d  e  f
00:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
10:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
20:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
30:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
40:  40  --  --  --  --  --  --  48  --  --  --  --  --  --  --  --
50:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
60:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
70:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
pi@raspberrypi:~ $
```

If an I2C device is connected to your RPI, its I2C address will be displayed here.

Step 3 Install PyQt5

The project code is based on PyQt5. So operation of the program requires the support of PyQt5.

Open the terminal and execute the following command to install PyQt5. **(Note: Here are three commands. Please excite commands in order.)**

```
sudo apt-get update
sudo apt-get upgrade
sudo apt-get install python3-pyqt5
sudo apt-get install python3-dev
```

Installation need much time. Please wait with patience.

Step 4 Install WS281X library

Install WS281X library in Raspberry Pi, which is used for WS281X RGB LED on the car.

1. Execute following command in turn to install WS281X library.

```
sudo pip3 install rpi_ws281x
```

```
pi@raspberrypi:/usr/bin $ sudo pip3 install rpi_ws281x
Looking in indexes: https://pypi.org/simple, https://www.piwheels.org/simple
Collecting rpi_ws281x

Installing collected packages: rpi-ws281x
Successfully installed rpi-ws281x-4.2.3
pi@raspberrypi:/usr/bin $
```

Step 5 Install Opencv library

Execute following commands in the terminal to install Opencv library:

1.install opencv development environment:

```
sudo apt-get install -y libopencv-dev python3-opencv
```

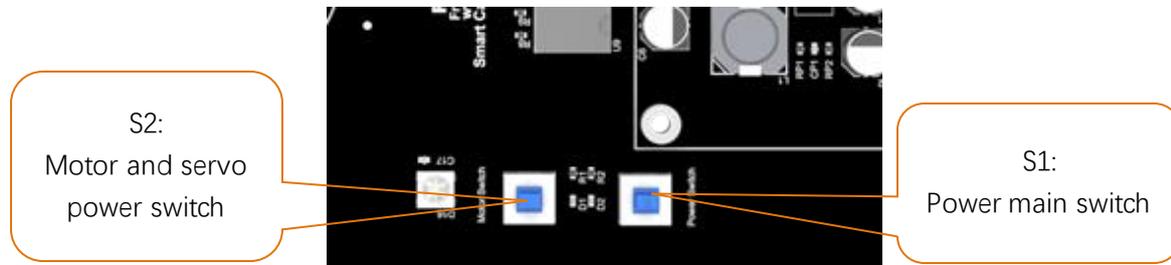

2.Install some tools:

```
sudo apt-get install -y python3-pil python3-tk
```

Step 6 Module test (necessary)

If you have any concerns, please feel free to contact us via support@freenove.com

In this section, the car must be equipped with **batteries**, and **Both S1** power switch and **S2** motor switch need be **pressed**. Then 5V, 3.3V, battery power indicators will be turned on.

During the test, the motor will work. So you can disconnect the wheels or put it on the ground to avoid that it falls down and is damaged. Next, test RGB LED, motor, ultrasonic module, servo, etc.

You can still power Raspberry Pi with a power supply Cable when switches are pressed.

If you have never learned python before, you can learn some basic knowledge via the link below:
<https://python.swaroopch.com/basics.html>

Motor

Run program

Open the terminal of Raspberry Pi. Enter the following commands to test the motor.

1. Use the cd command to enter the directory where test.py is located.

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Execute test.py command:

```
sudo python test.py Motor
```

```
pi@raspberrypi: ~/Freenove_4WD_Sma...Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo python
test.py Motor
Program is starting ...
The car is moving forward
The car is going backwards
The car is turning left
The car is turning right

End of program
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

Result:

The car moves forward for 1 seconds, then moves back for 1 seconds, then turns left for 1 seconds, turns right for 1 seconds, then stops. You can press "Ctrl + C" to end the program ahead of time. **If the car doesn't work normal, please check if both switches are pressed.**

If the direction is reversed, it moves back then move forward, please follow steps below.

1. Find Motor.py in following path in your Raspberry Pi:

Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server/Motor.py

Open Motor.py and add a "-" before duty1,2,3,4 like below.

```
1 def setMotorModel (self, duty1, duty2, duty3, duty4) :
2     duty1, duty2, duty3, duty4=self. duty_range (duty1, duty2, duty3, duty4)
3     self. left_Upper_Wheel (-duty1)
4     self. left_Lower_Wheel (-duty2)
5     self. right_Upper_Wheel (-duty3)
6     self. right_Lower_Wheel (-duty4)
```

Then save the modification and try again.

The code is as below:

```

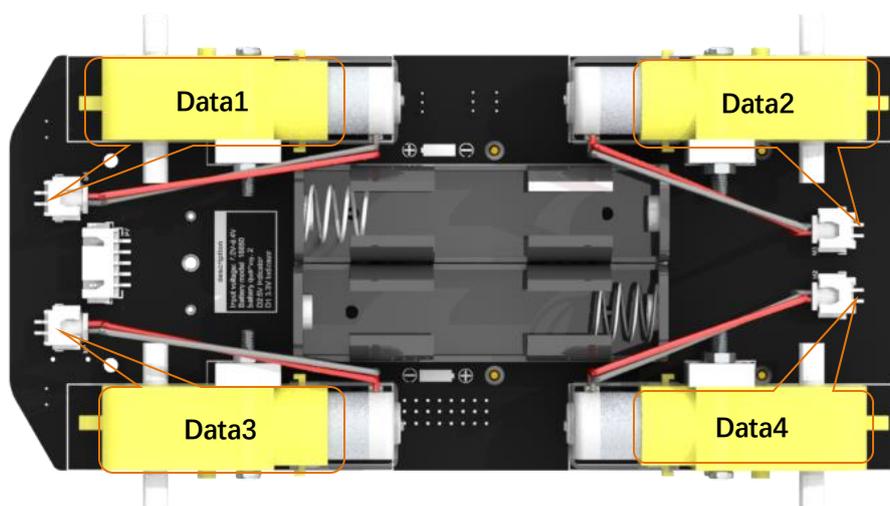

1  from Motor import *
2  PWM=Motor()
3  def test_Motor():
4      try:
5          PWM.setMotorModel(1000,1000,1000,1000)    #Forward
6          print "The car is moving forward"
7          time.sleep(1)
8          PWM.setMotorModel(-1000,-1000,-1000,-1000) #Back
9          print "The car is going backwards"
10         time.sleep(1)
11         PWM.setMotorModel(-1500,-1500,2000,2000)    #Left
12         print "The car is turning left"
13         time.sleep(1)
14         PWM.setMotorModel(2000,2000,-1500,-1500)    #Right
15         print "The car is turning right"
16         time.sleep(1)
17         PWM.setMotorModel(0,0,0,0)                    #Stop
18         print "\nEnd of program"
19     except KeyboardInterrupt:
20         PWM.setMotorModel(0,0,0,0)
21         print "\nEnd of program"

```

Reference

setMotorModel(data1,data2,data3,data4)

This function has four input parameters that control the left front motor, the left rear motor, the right front motor, and the right rear motor. When the input parameter is within 0~4096, the motor will rotate forward. If it is within -4096~0, the motor will rotate reverse. The larger the absolute value is, the larger the motor speed is. When the input is 0, the motor will stop. If the function has following input: setMotorModel(2000,2000, 2000, 2000), four motors will rotate forward and the car will move forward.

ADC Module

Run program

Enter following commands to test ADC module.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

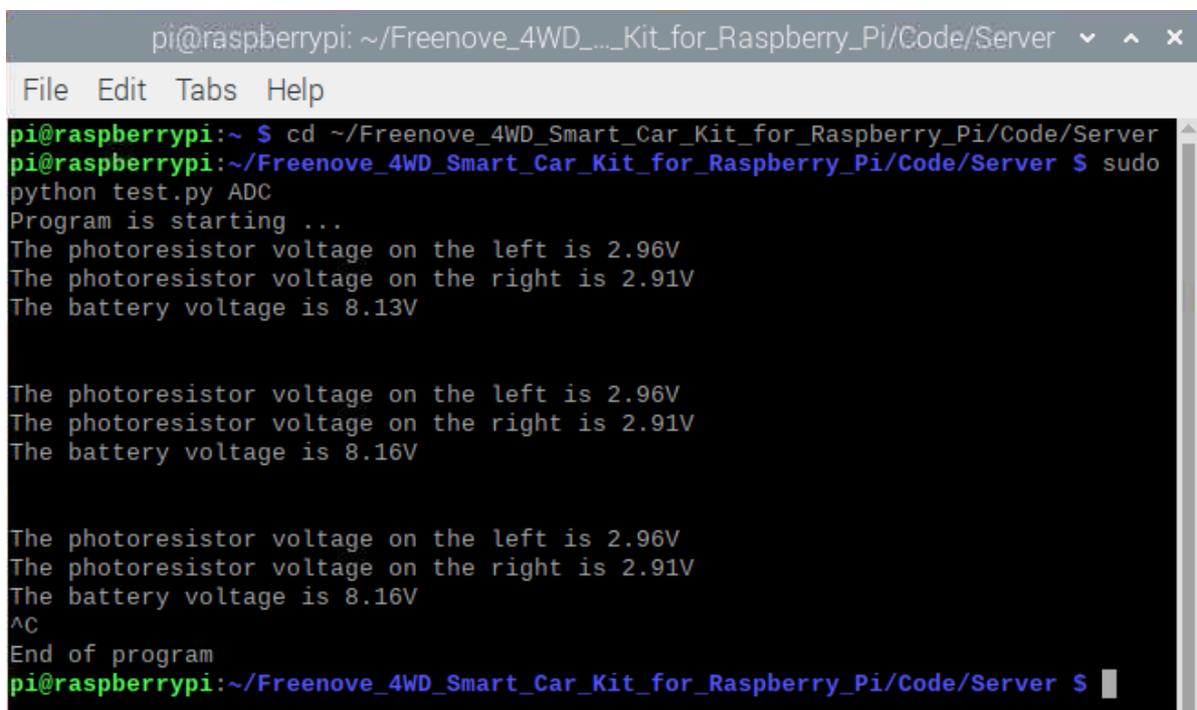

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1. If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Execute test.py command:

```
sudo python test.py ADC
```

```
pi@raspberrypi: ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python test.py ADC
Program is starting ...
The photoresistor voltage on the left is 2.96V
The photoresistor voltage on the right is 2.91V
The battery voltage is 8.13V

The photoresistor voltage on the left is 2.96V
The photoresistor voltage on the right is 2.91V
The battery voltage is 8.16V

The photoresistor voltage on the left is 2.96V
The photoresistor voltage on the right is 2.91V
The battery voltage is 8.16V
^C
End of program
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

Result:

Every 1s, the voltage value of the two photoresistors and the battery voltage value are output. The value read for the first time is not stable and inaccurate when the chip just starts. It will be stable later. You can press "Ctrl + C" to end program.

The code is as below:

```
1  from ADC import *
2  adc=Adc()
3  def test_Adc():
4      try:
5          while True:
6              Left_IDR=adc.recvADC(0)
7              print ("The photoresistor voltage on the left is "+str(Left_IDR)+"V")
8              Right_IDR=adc.recvADC(1)
9              print ("The photoresistor voltage on the right is "+str(Right_IDR)+"V")
10             Power=adc.recvADC(2)
11             print ("The battery voltage is "+str(Power*3)+"V")
12             time.sleep(1)
13             print '\n'
14         except KeyboardInterrupt:
15             print "\nEnd of program"
```

Reference

recvADC(channel)

This function has only one input parameter, which can be 0, 1 or 2.

When the input is **0**, the value of this function is the voltage value of the **left** photoresistor.

When the input is **1**, the value of this function is the voltage value of the **right** photoresistor.

When the input is **2**, the value of this function is the voltage value of the **battery after divided**. After multiplying by 3, it is the actual battery voltage value

Infrared Line tracking module

Run program

Enter following command in the terminal to test Line tracking module.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1. If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Execute test.py command:

```
sudo python test.py Infrared
```

```
pi@raspberrypi: ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python test.py Infrared
Program is starting ...
```

Result:

When the black line is on the left side of the module, the left LED will light up and the terminal will print "Left";
When the black line is in the middle of the module, the middle LED will light up and the terminal will print "Middle".

When the black line is on the right side of the module, right The LED will light up, the terminal will print "Right",
You can press "Ctrl + C" to end the program.

The code is as below:

```
1 from Infrared_Obstacle_Avoidance import *
2 def test_Infrared():
3     try:
4         while True:
5             if GPIO.input(IR01)!=True and GPIO.input(IR02)==True and GPIO.input(IR03)!=True:
6                 print 'Middle'
7             elif GPIO.input(IR01)!=True and GPIO.input(IR02)!=True and GPIO.input(IR03)==True:
8                 print 'Right'
9             elif GPIO.input(IR01)==True and GPIO.input(IR02)!=True and GPIO.input(IR03)!=True:
10                print 'Left'
11        except KeyboardInterrupt:
12            print "\nEnd of program"
```

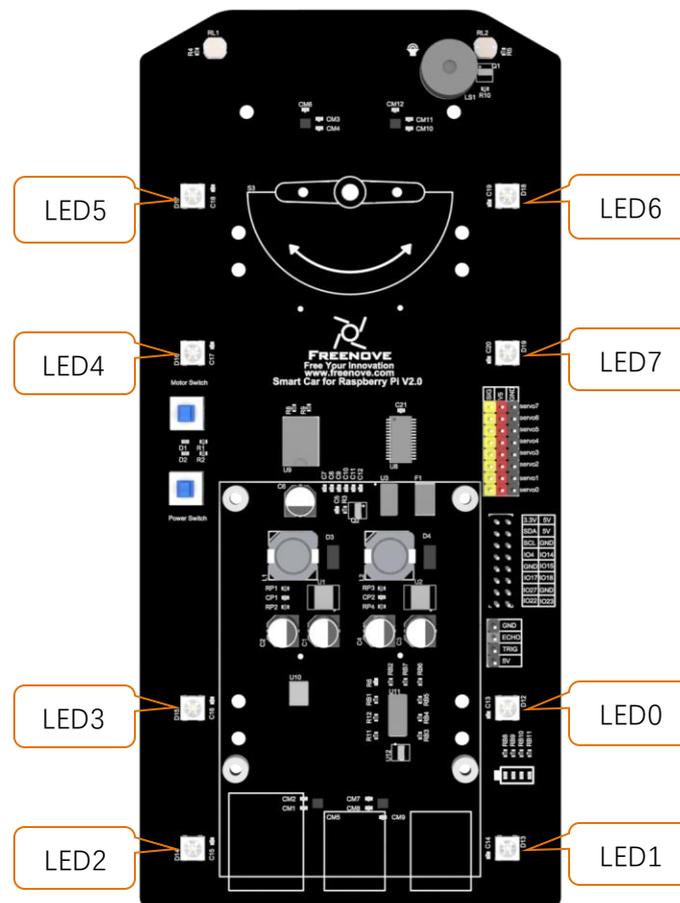

Reference

GPIO.input(IO)

This function has an input parameter. If the IO input is high level, GPIO.input(IO) returns True. If the IO input is low level, GPIO.input(IO) returns False.

Led

There are 8 RGB LEDs on the smart car board, as is below. You can control them separately.

Run program

Enter the following commands to test LED.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1.If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2.Execute test.py command:

```
sudo python test.py Led
```

```

pi@raspberrypi: ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python test.py Led
Program is starting ...
The LED has been lit, the color is red orange yellow green cyan-blue blue white
End of program
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $

```

Result:

All LEDs will be turned on for 3 seconds, and color of LED0 to LED7 are: red, orange, yellow, green, cyan, blue, purple, and white. You can end the program ahead of time by pressing "ctrl+c".

If the LED color display order is not correct, open the "**Led.py**" file in the current directory and modify the value of the "self.ORDER" variable on line 15.

The code of test.py is as below:

```

1  import time
2  try:
3      from Led import *
4      led=Led()
5      def test_Led():
6          try:
7              led.ledIndex(0x01, 255, 0, 0)    #Red
8              led.ledIndex(0x02, 255, 125, 0)  #orange
9              led.ledIndex(0x04, 255, 255, 0)  #yellow
10             led.ledIndex(0x08, 0, 255, 0)    #green
11             led.ledIndex(0x10, 0, 255, 255)  #cyan-blue
12             led.ledIndex(0x20, 0, 0, 255)    #blue
13             led.ledIndex(0x40, 128, 0, 128)  #purple
14             led.ledIndex(0x80, 255, 255, 255) #white
15             print "The LED has been lit, the color is red orange yellow green cyan-blue blue
16             white"
17             time.sleep(3)                    #wait 3s
18             led.colorWipe(led.strip, Color(0,0,0)) #turn off the light
19             print "\nEnd of program"
20         except KeyboardInterrupt:
21             led.colorWipe(led.strip, Color(0,0,0)) #turn off the light
22             print "\nEnd of program"
23     except:
24         pass

```

Reference

ledIndex(Index, R, G, B)

This function has 4 parameters.

The first one is index of the LED you want to control. Its value is hexadecimal. There are LED0~7.

The rest 3 parameter is R G B value of color.

For example, `ledeindex(0x01,255,0,0)` makes LED 0 light to red; `ledeindex(0x40,0,255,0)` makes LED 6 light green.

colorWipe(strip, color, wait_ms)

This function erases the color of one pixel at a time, has three input parameters, strip represents the Neopixel object, color represents the color to be erased, and wait_ms represents the erasure interval. The default is 50ms. For example, `colorWipe(strip, Color(255,0,0),20)` means that the LED0 color is red first, wait for 20ms, and then the LED1 color is also red, so that all eight LEDs are lit and red.

Buzzer

Run the program

Enter following command in the terminal to test buzzer.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1.If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2.Execute test.py command:

```
sudo python test.py Buzzer
```

```
pi@raspberrypi: ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python test.py Buzzer
Program is starting ...
1S
2S
3S
End of program
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

Result:

The buzzer will be turn on lasting for 3s. Then the program will automatically end or you can press "Ctrl + C" to end the program.

The code is as below:

```
1  from Buzzer import *
2  buzzer=Buzzer()
3  def test_Buzzer():
4      try:
5          buzzer.run(cmd.CMD_START)
6          time.sleep(1)
7          print "1S"
8          time.sleep(1)
9          print "2S"
10         time.sleep(1)
11         print "3S"
12         buzzer.run(cmd.CMD_STOP)
13         print "\nEnd of program"
14     except KeyboardInterrupt:
15         buzzer.run(cmd.CMD_STOP)
16         print "\nEnd of program"
```

Reference

buzzer.run(cmd)

This function has one input parameter. If the input is '1', the buzzer will be turned on. If the input is '0', the buzzer will be turned off.

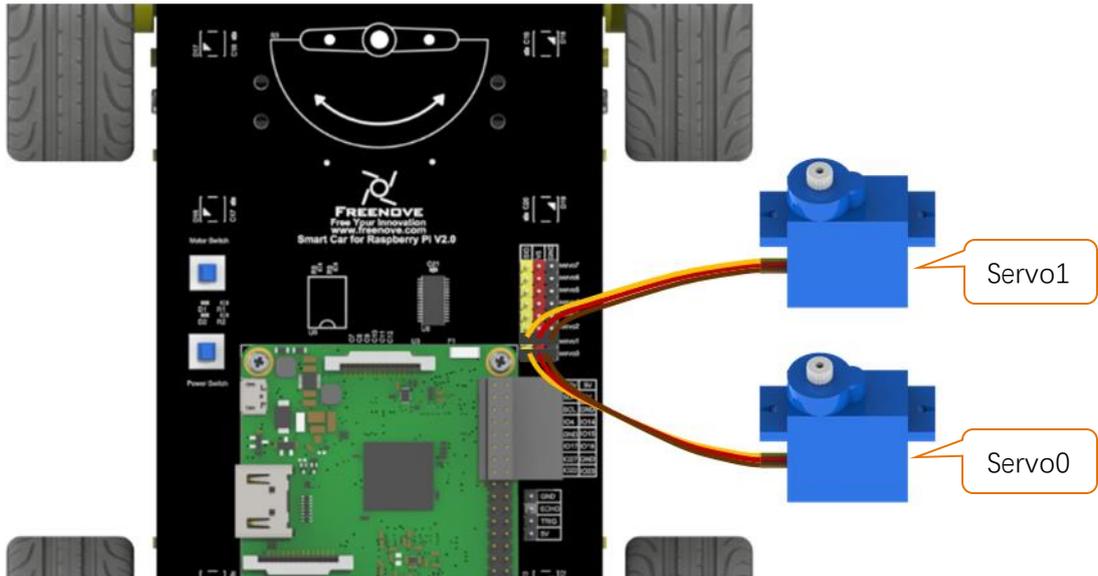

Servo

Run program

In the first chapter, we did not install the Pan-Tilt. Because we need run program for the installation of the servos to ensure that the servos rotate to the correct angle.

Next let's install the Pan-Tilt.

Connect two servos to port Servo0 and port Servo1 on the smart car board. And please remember the numbers of the servos.

Enter following command in the terminal:

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1.If not, execute the cd command:

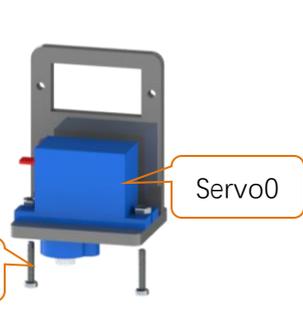

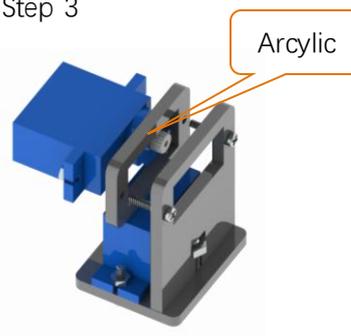

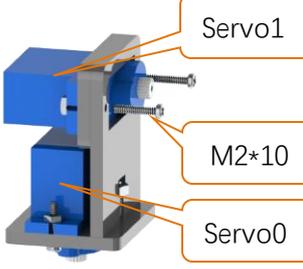

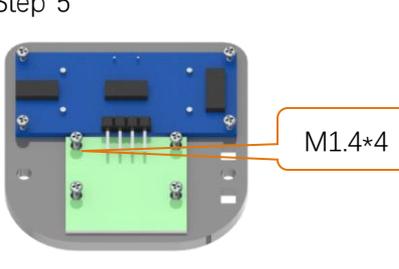

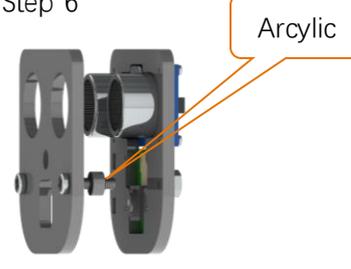

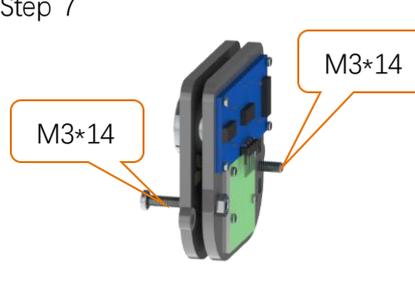

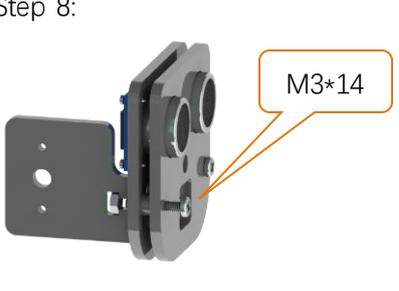

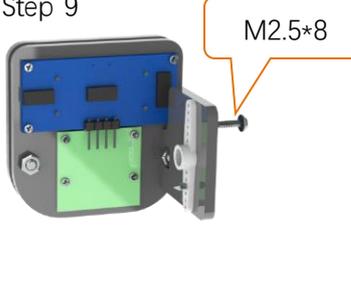

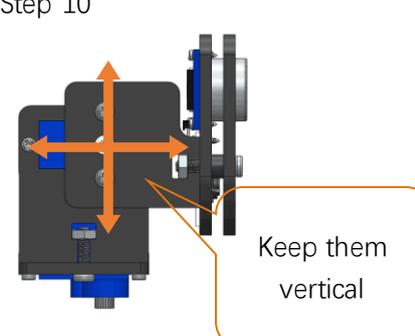

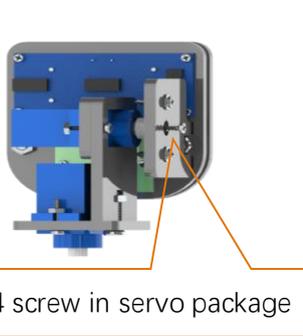

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2.Execute Servo.py command:

```
sudo python servo.py
```

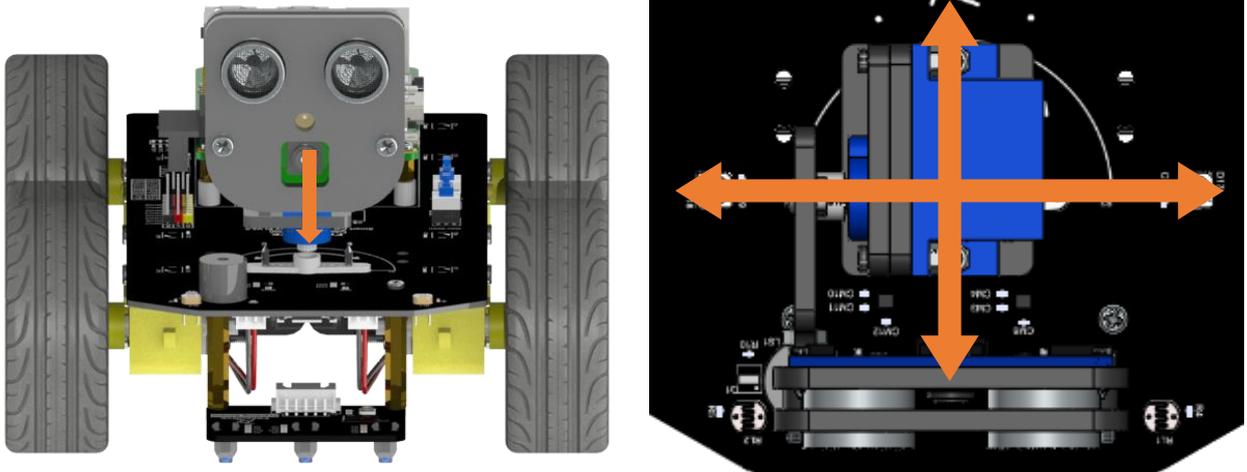

Then servos rotate to the proper angle. Please keep the connection between the servos and the smart car board.

Installation steps: (Note: Do not disorder Servo0 and Servo1 during the installation.)

<p>Step 1</p>  <p>Acrylic part</p> <p>M3*14</p>	<p>Step 2</p>  <p>Servo0</p> <p>M2*10</p>	<p>Step 3</p>  <p>Acrylic</p>
<p>Step 4</p>  <p>Servo1</p> <p>M2*10</p> <p>Servo0</p>	<p>Step 5</p>  <p>M1.4*4</p>	<p>Step 6</p>  <p>Acrylic</p>
<p>Step 7</p>  <p>M3*14</p> <p>M3*14</p>	<p>Step 8:</p>  <p>M3*14</p>	<p>Step 9</p>  <p>M2.5*8</p>
<p>Step 10</p>  <p>Keep them vertical</p>	<p>Step 11</p>  <p>M2*4 screw in servo package</p>	<p>After finished</p> 

Install Pan Tilt on smart car board.

Step 1

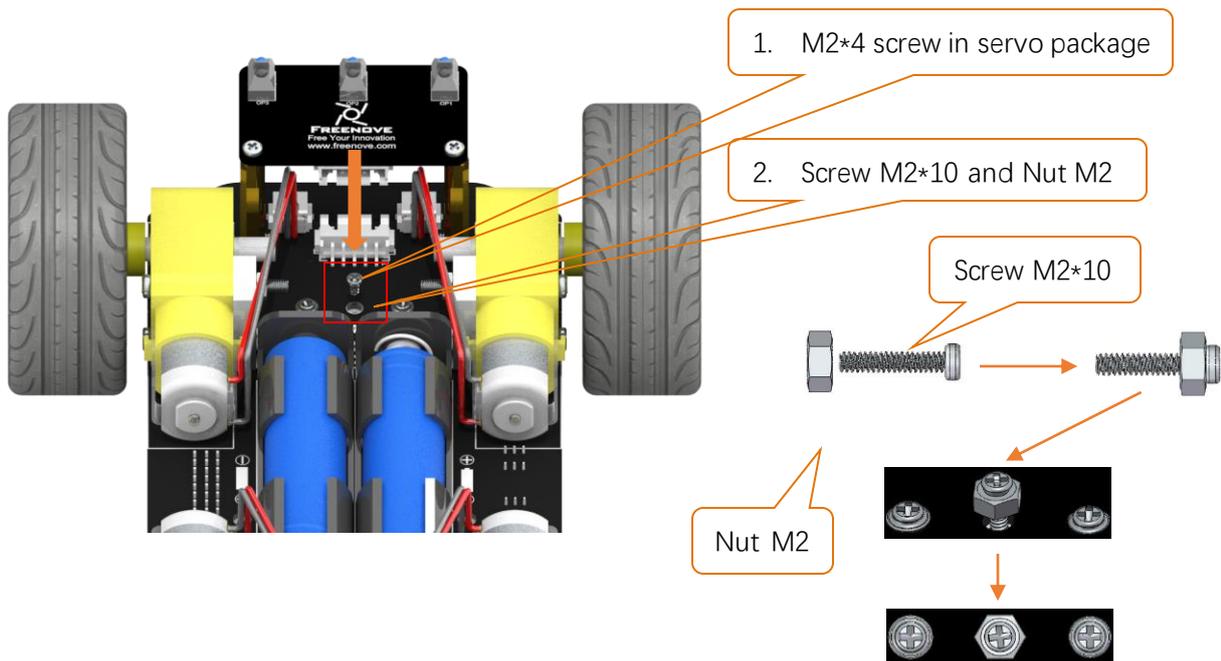

Keep the pan tilt as right picture and install servo0 with rocker arm.

Step 2

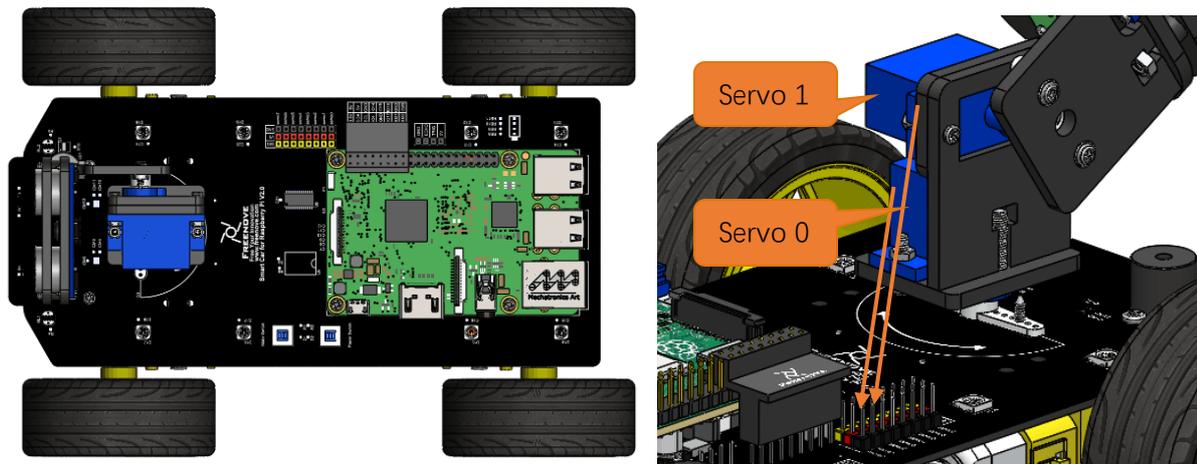

Two ways to fix servo 0.

1. Use a Cross screwdriver to support the M2 * 4 screws to fix the servo 0.
2. Use a Cross screwdriver to support M2 * 10 screws and M2 nuts to fix the servo 0.

Please choose one of the ways

Step 3

Pay attention to servo wiring.

(note: wiring about the ultrasonic and camera module will be introduced later.)

Enter following commands in the terminal to test servos.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1. If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Execute test.py command:

```
sudo python test.py Servo
```

```
pi@raspberrypi: ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python test.py Servo
Program is starting ...
█
```

Result:

The servo 0 repeats rotating from left to right and then from right to left. The servo 1 repeats rotating from bottom to top and then from top to bottom. You can press "Ctrl + C" to end the program.

The code is as below:

```
1  from servo import *
2  pwm=Servo()
3  def test_Servo():
4      try:
5          while True:
6              for i in range(50,110,1):
7                  pwm.setServoPwm('0', i)
8                  time.sleep(0.01)
9              for i in range(110,50,-1):
10                 pwm.setServoPwm('0', i)
11                 time.sleep(0.01)
12             for i in range(80,150,1):
13                 pwm.setServoPwm('1', i)
14                 time.sleep(0.01)
15             for i in range(150,80,-1):
16                 pwm.setServoPwm('1', i)
17                 time.sleep(0.01)
18         except KeyboardInterrupt:
19             pwm.setServoPwm('0',90)
20             pwm.setServoPwm('1',90)
21         print "\nEnd of program"
```

Reference

setServoPwm(Servo,angle)

There are 2 parameters.

The first one is related to servo index.

The second one is related to angle of servo.

For example,

setServoPwm('0',20) makes servo0 rotate to 20.

setServoPwm('1',90) makes servo1 rotate to 90.

```

pi@raspberrypi: ~/Freenove_4WD_Kit_for_Raspberry_Pi/Code/Server

```

Result:

Every 1s, the distance between the obstacle and the ultrasonic module will be printed in, and you can press "Ctrl + C" to end the program.

The code is as below:

```

1  from Ultrasonic import *
2  ultrasonic=Ultrasonic()
3  def test_Ultrasonic():
4      try:
5          while True:
6              data=ultrasonic.get_distance() #Get the value
7              print ("Obstacle distance is "+str(data)+"CM")
8              time.sleep(1)
9          except KeyboardInterrupt:
10             print "\nEnd of program"

```

Reference

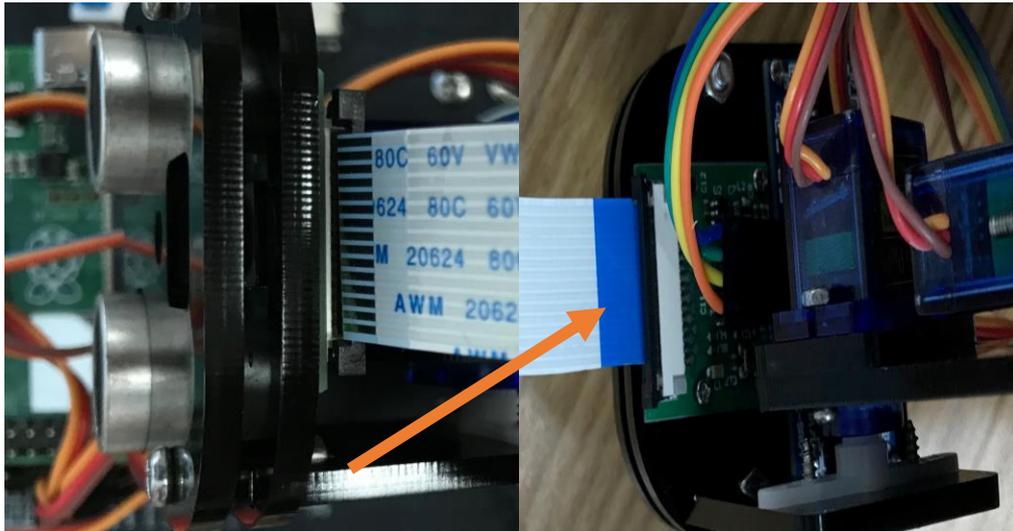

get_distance()

This function is used to obtain the distance of ultrasonic module and front obstacle, with unit CM.

Camera

Next let's connect the camera to smart car board. First **turn off S1** (Power Switch), **shut down Raspberry Pi** and disconnect power cable. If the data cable is used to power the Raspberry Pi, disconnect the data cable and install the CSI camera to the Raspberry Pi camera interface when the Raspberry Pi is powered off. **(The CSI camera must be connected or disconnected under no power and Raspberry Pi is shut down, or the camera may be burned.)**

Step 1

The Blue side of cable should be toward to Servo.

Connect one end of cable to camera. Please note front and back of the cable.

Step 2

The Blue side of cable should be toward to RPi USB port.

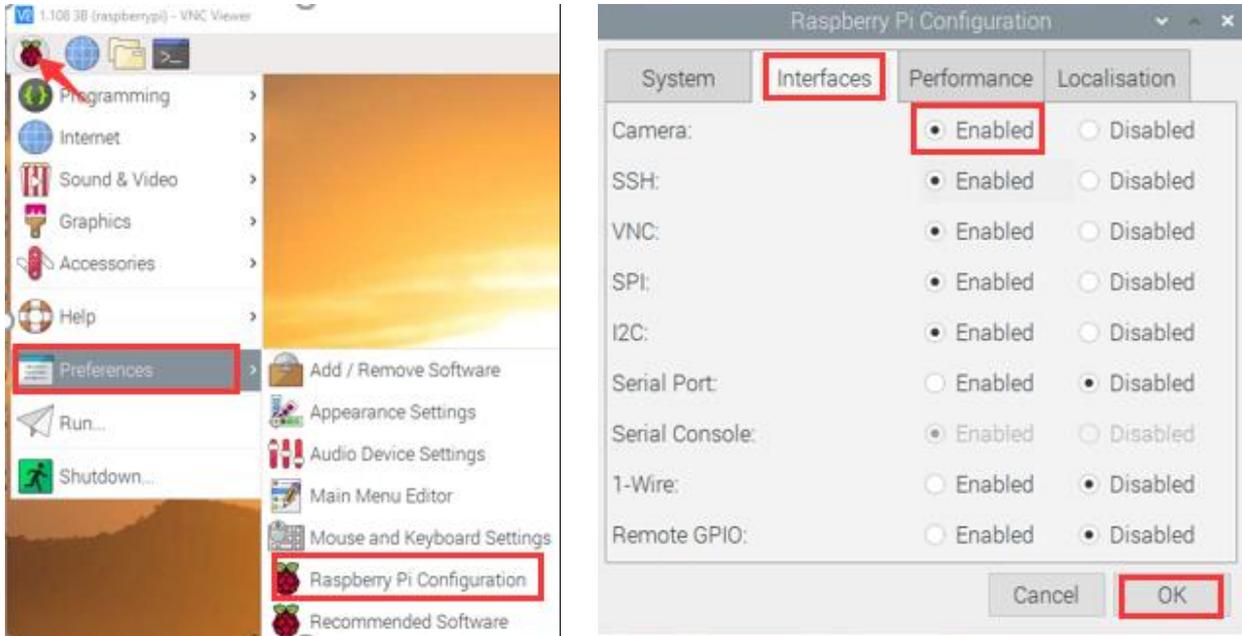

Connect another end of cable to raspberry pi. Please note front and back of the cable.

Enable camera

Turn on S1 or use cable to power Raspberry Pi, and start it.

If you are using remote desktop mode to login Raspberry Pi, you need use [VNC viewer](#).

Then follow steps below to enable camera:

Then reboot Raspberry Pi.

Then reboot Raspberry Pi and enter following commands:

```
ls /dev/video0
```

Then the device node will be shown below:

```
pi@raspberrypi: ~
File Edit Tabs Help
pi@raspberrypi:~ $ ls /dev/video0
/dev/video0
pi@raspberrypi:~ $
```

Run program

Enter following commands in the terminal to test camera.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

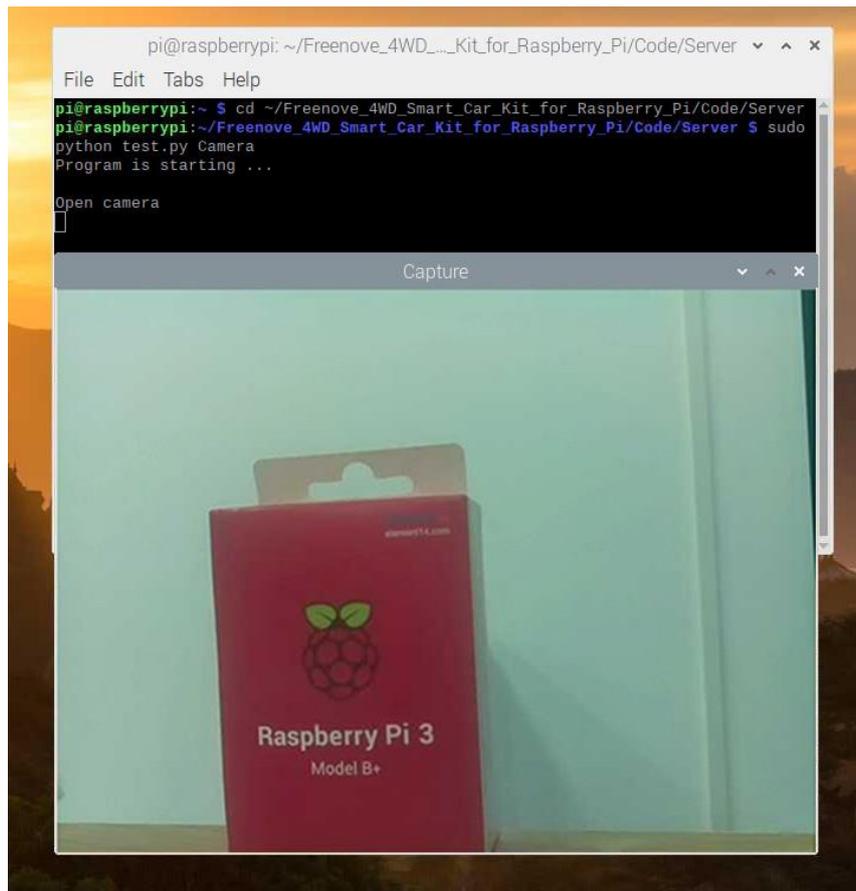

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1. If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Execute test.py command:

```
sudo python test.py Camera
```

**Result:**

A window will pop up and display the picture shot by the camera. Press “Ctrl + “C” in the **terminal** window to end the program. (Note: pressing “Ctrl + C” in the **camera** window doesn’t work.)

The code is below:

```
1 import cv2
2 def test_Camera():
3     try:
4         print "\nOpen camera"
5         capturing_Flag = True
6         cap = cv2.VideoCapture(0)
7         while(capturing_Flag):
8             ret, frame = cap.read()
9             cv2.imshow("Capture", frame)
10            cv2.waitKey(5)
11            cv2.destroyAllWindows()
12    except KeyboardInterrupt:
13        print "\nClose camera"
14        capturing_Flag = False
```

Chapter 3 LED Show

If you have any concerns, please feel free to contact us via support@freenove.com

Description

In the test of Chapter 2, we have controlled 8 LEDs to display different colors in turn. On this basis, we add some algorithm in this chapter to make the LED display more styles. You can take this as a reference, then you can use your imagination to write your own algorithm to achieve your LED style you want.

Run Program

If the terminal displays the directory as below. You can **directly** run the Led.py.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1.If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2.Run Led.py:

```
sudo python Led.py
```

```
pi@raspberrypi: ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python Led.py
Program is starting ...
Chaser animation
Rainbow animation
^Cpi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

You can press "Ctrl + C" to end the program.

Part of code is as below:

```
1  # -*-coding: utf-8 -*-
2  import time
3  from rpi_ws281x import *
4  # LED strip configuration:
5  LED_COUNT      = 8      # Number of LED pixels.
6  LED_PIN        = 18     # GPIO pin connected to the pixels (18 uses PWM!).
7  LED_FREQ_HZ    = 800000 # LED signal frequency in hertz (usually 800khz)
8  LED_DMA        = 10     # DMA channel to use for generating signal (try 10)
9  LED_BRIGHTNESS = 255    # Set to 0 for darkest and 255 for brightest
10 LED_INVERT     = False  # True to invert the signal (when using NPN transistor level shift)
11 LED_CHANNEL    = 0      # set to '1' for GPIOs 13, 19, 41, 45 or 53
```

```
12 # Define functions which animate LEDs in various ways.

95             led.colorWipe(led.strip, Color(0,0,0),10)
96         except KeyboardInterrupt: # When 'Ctrl+C' is pressed, the child program destroy() will be
97             executed.
98             led.colorWipe(led.strip, Color(0,0,0),10)

```

Reference

strip.setPixelColor(Index,color(R,G,B))

This function is a function of WS2812 library. It is same as the previously customized ledIndex() function. It is used to lights up one LED and has two input parameters. The first one is the LED number, the second one is used to set the color of the LED. For example, strip.setPixelColor(1,Color(255, 0, 0)), and write strip.show() in the next line, then LED1 will show red color light.

strip.show()

This function is of WS2812 library. When the LED color is set, this function needs to be executed, then the LED will show the corresponding color. After the color is set; LED will still has not change if this function is not executed.

wheel(pos)

Generate rainbow colors in range of 0-255.

LED_TYPR(self,order,R_G_B)

Change the order in which the LED color data is transmitted. When the value of the order parameter is "RGB", the order of data transmission should be: R-G-B; when the value of the order parameter is "GBR", and the order of data transmission should be: G-B-R

theaterChaseRainbow(strip, wait_ms)

The function is used to make 8 Leds show one color at the same time, and change various colors to **blink**. The blinking interval is wait_ms, and the default value is 50ms.

rainbow(strip, wait_ms,)

This function achieves the effect of rainbow **breathing**. It makes 8 Leds display **same** color at the same time, and then change all various colors like breathing. The interval is wait_ms. The default value is 20ms.

rainbowCycle(strip, wait_ms)

This function also achieves the effect of rainbow **breathing**. but unlike rainbow(), it makes eight Leds to display **different** colors at the same time, and then change various color separately. The interval is wait_ms. The default value is 20ms.

Result analysis

This code mainly achieves two LED effects, chasing animation and rainbow animation.

Chasing animation: first let the 8 LEDs light red one by one in turn, then green and blue. Interval is 50ms between two LED, so the LED will display a round of red, then another round of green, the last round of blue Color, like chasing. And then let the LEDs blink with an interval of 50ms, with different colors, render a tense atmosphere, thus complete the chase animation.

Rainbow animation: The effect of the rainbow is different from the effect blinking. The blinking is to make the LED on, off, on, and off. And the rainbow is to make LED on all the time, and switch between different colors, and the interval is shorter than the blinking. First, make the eight LEDs display one color at the same time and then change the color with intervals of 20ms. And then make the eight LEDs display different colors at the same time, and then change the color to produce another rainbow effect.

Chapter 4 Light tracing Car

If you have any concerns, please feel free to contact us via support@freenove.com

Description

The light-seeking function of the car is mainly use a photoresistor. The car has two photoresistors located at both ends of the front to detect light.

The photoresistor is a resistor based on the photoelectric effect of the semiconductor. The resistance changes with the intensity of the incident light. With the incident light intensity increasing, the resistance decreases. With the incident light intensity decreasing, the resistance increases.

And the change of the resistance value also causes voltage applied to the photoresistor changes. According to the change of voltage, the position of the light to the car will be detected, and then make the car move corresponding action to trace light.

Put your car in a darker environment.

Run program

If the terminal displays the directory as below. You can **directly** execute the Light.py command.

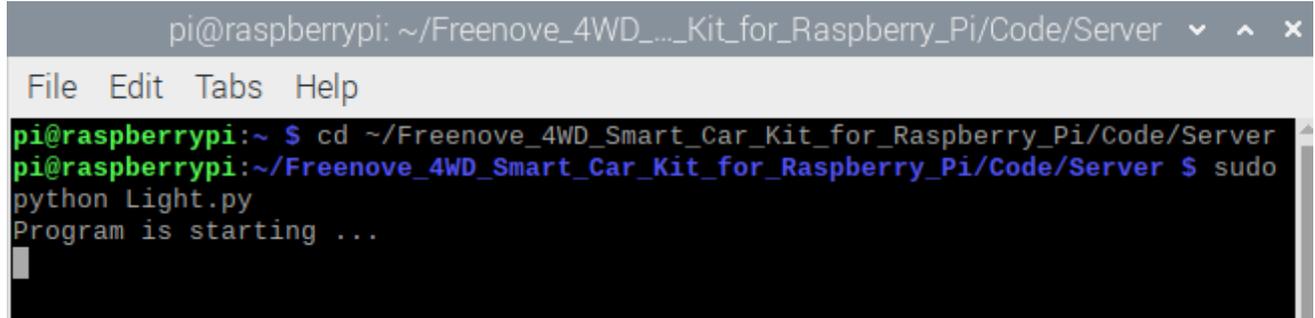

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1. If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Run Light.py:

```
sudo python Light.py
```

```
pi@raspberrypi: ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python Light.py
Program is starting ...
```

You can press "Ctrl + C" to end the program.

The code is below:

```
1  import time
2  from Motor import *
3  from ADC import *
4  class Light:
5      def run(self):
6          try:
7              self.adc=Adc()
8              self.PWM=Motor()
9              self.PWM.setMotorModel(0,0,0,0)
10             while True:
11                 L = self.adc.recvADC(0)
12                 R = self.adc.recvADC(1)
13                 if L < 2.99 and R < 2.99 :
14                     self.PWM.setMotorModel(600,600,600,600)
15
16                 elif abs(L-R)<0.15:
17                     self.PWM.setMotorModel(0,0,0,0)
18
19                 elif L > 3 or R > 3:
20                     if L > R :
21                         self.PWM.setMotorModel(-1200,-1200,1400,1400)
22
23                     elif R > L :
24                         self.PWM.setMotorModel(1400,1400,-1200,-1200)
25
26             except KeyboardInterrupt:
27                 led_Car.PWM.setMotorModel(0,0,0,0)
28
29 if __name__=='__main__':
30     print('Program is starting...')
31     led_Car=Light()
32     led_Car.run()
```

Result analysis

When the voltages left and right photoresistor are less than 2.99, the car move forward straight. and When one of the voltages is greater 3v:

If the left voltage is greater than the right, the car turns left.

If the right voltage is greater than the left, the car turns right.

You can change the judgment of the program to achieve the result you want, according to the light intensity of the environment.

Chapter 5 Ultrasonic Obstacle Avoidance Car

If you have any concerns, please feel free to contact us via support@freenove.com

Description

The obstacle avoidance function of the car mainly uses the HC-SR04 ultrasonic module. The ultrasonic module is controlled by the servo. The servo rotates to the left, middle and right repeatedly. The ultrasonic module measures the obstacle distance on the left, middle and right directions. Then control the car to move according to different distances.

Run program

If the terminal displays the directory as below. You can **directly** run the Ultrasonic.py.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1. If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Run Ultrasonic.py:

```
sudo python Ultrasonic.py
```

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python Ultrasonic.py
Program is starting ...
```

You can press "Ctrl + C" to end the program.

Part of code is as below:

```

1     def run(self):
2         self.PWM=Motor()
3         self.pwm_S=Servo()
4         for i in range(30, 151, 60):
5             self.pwm_S.setServoPwm('0', i)
6             time.sleep(0.2)
7             if i==30:
8                 L = self.get_distance()
9             elif i==90:
10                M = self.get_distance()
11            else:
12                R = self.get_distance()
13            while True:
```

```

14         for i in range(90,30,-60):
15             self.pwm_S.setServoPwm('0',i)
16             time.sleep(0.2)
17             if i==30:
18                 L = self.get_distance()
19             elif i==90:
20                 M = self.get_distance()
21             else:
22                 R = self.get_distance()
23             self.run_motor(L,M,R)
24         for i in range(30,151,60):
25             self.pwm_S.setServoPwm('0',i)
26             time.sleep(0.2)
27             if i==30:
28                 L = self.get_distance()
29             elif i==90:
30                 M = self.get_distance()
31             else:
32                 R = self.get_distance()
33             self.run_motor(L,M,R)
34 ultrasonic=Ultrasonic()
35 # Main program logic follows:
36 if __name__ == '__main__':
37     print ('Program is starting... ')
38     try:
39         ultrasonic.run()
40     except KeyboardInterrupt: # When 'Ctrl+C' is pressed, the child program destroy() will be
41 executed.
42         PWM.setMotorModel(0,0,0,0)
43         ultrasonic.pwm_S.setServoPwm('0',90)

```

Result analysis

Let servo0 rotate back and forth, 30 degrees, 90 degrees, 150 degrees respectively. Then ultrasonic module also follows the movement to measure the obstacle distance of these three angles.

When the distance between the left>30cm, middle >30cm, right>30cm. It means that there is no obstacle within 30cm. Then make the car move forward.

When distances detected on the left<30cm, middle <30cm, right<30cm, it means that the car enters a dead end, then make the car move back and turned back.

When the distance between the left<30cm, middle <30cm, right>30cm. It means that there is an obstacle on the left side of the car, then make the car turn right.

When the distance between the left>30cm, middle <30cm, right<30cm. It means that there is an obstacle on the right side of the car, then make the car turn left.

Chapter 6 Infrared line tracking Car

If you have any concerns, please feel free to contact us via support@freenove.com

Description

The line tracing function of the car mainly uses the infrared module. When the sensor detects black line the corresponding led will light up. Control the car move according to the value of three sensors.

Run program

If the terminal displays the directory as below. You can **directly** run the program.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

1. If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Run Line_Tracking.py:

```
sudo python Line_Tracking.py
```

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo python Line_Tracking.py
Program is starting ...
█
```

You can press "Ctrl + C" to end the program.

The code is below:

```
1 import time
2 from Motor import *
3 import RPi.GPIO as GPIO
4 IR01 = 14
5 IR02 = 15
6 IR03 = 23
7 GPIO.setmode(GPIO.BCM)
8 GPIO.setup(IR01, GPIO.IN)
9 GPIO.setup(IR02, GPIO.IN)
10 GPIO.setup(IR03, GPIO.IN)
11 class Line_Tracking:
12     def run(self):
```

```

13     while True:
14         self.LMR=0x00
15         if GPIO.input(IR01)==True:
16             self.LMR=(self.LMR | 4)
17         if GPIO.input(IR02)==True:
18             self.LMR=(self.LMR | 2)
19         if GPIO.input(IR03)==True:
20             self.LMR=(self.LMR | 1)
21         if self.LMR==2:
22             PWM.setMotorModel(800, 800, 800, 800)
23         elif self.LMR==4:
24             PWM.setMotorModel(-1500, -1500, 2500, 2500)
25         elif self.LMR==6:
26             PWM.setMotorModel(-2000, -2000, 4000, 4000)
27         elif self.LMR==1:
28             PWM.setMotorModel(2500, 2500, -1500, -1500)
29         elif self.LMR==3:
30             PWM.setMotorModel(4000, 4000, -2000, -2000)
31         elif self.LMR==7:
32             pass
33
34     infrared=Line_Tracking()
35     # Main program logic follows:
36     if __name__ == '__main__':
37         print('Program is starting... ')
38         try:
39             infrared.run()
40         except KeyboardInterrupt: # When 'Ctrl+C' is pressed, the child program destroy() will be
41     executed.
42         PWM.setMotorModel(0, 0, 0, 0)

```

Result analysis

There are 3 sensors on the left, middle and right. When the black line is detected by a sensor, it will show high level, or it is low.

When the sensor on left: high, middle: low, right: low. Make the car turns left lightly.

When the sensor on left: high, middle: high, right: low. Make the car turns left.

When the sensor on left: low, middle: high, right: low. Make the car move forward straight.

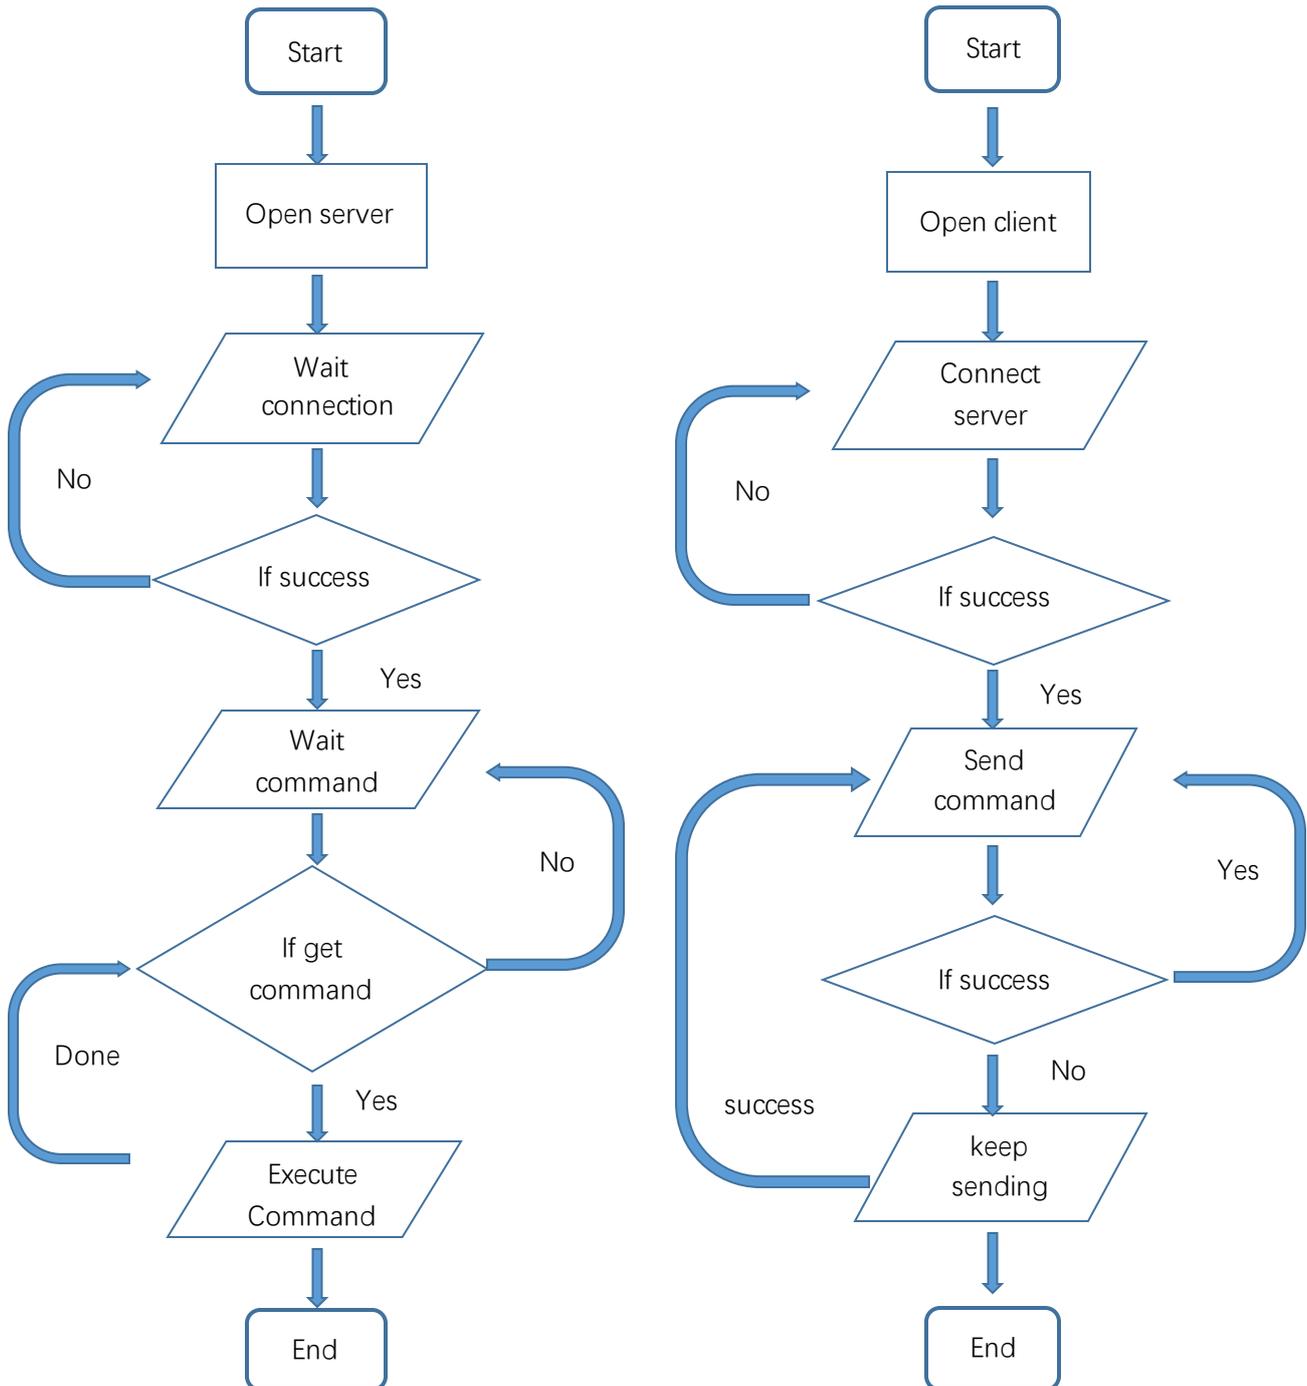

When the sensor on left: low, middle: low, right: high. Make the car turn right lightly.

When the sensor on left: low, middle: high, right: high. Make the car turn right.

Chapter 7 Smart video car

If you have any concerns, please feel free to contact us via support@freenove.com

The smart video car combines the functions of light tracing, obstacle avoidance and line tracing, transmit video, face detection, LED and other functions. And the server and the client are created. The car can be controlled remotely.

Server

The server works on the Raspberry Pi and can transmit camera data, ultrasonic data, etc. to the client, and receive commands from the client.

In the Server folder, there is a server.py file which contains main server code.

get_interface_ip() is used to get IP address of the native Raspberry Pi wlan0, without manually modifying the code to set IP parameters.

StartTcpServer() is used to start the TCP service. The channel of port 5000 is mainly used to send and receive commands between the client and the server. The channel of port 8000 is used for the server to transmit the collected camera data to the client.

StopTcpServer() is used to stop the TCP service.

sendvideo() is used to send the camera data.

Part of server code is as follows:

```
1 def get_interface_ip(self):
2     s = socket.socket(socket.AF_INET, socket.SOCK_DGRAM)
3     return socket.inet_ntoa(fcntl.ioctl(s.fileno(), 0x8915, struct.pack('256s',
4         "wlan0"[:15]))[20:24])
5 def StartTcpServer(self):
6     HOST=str(self.get_interface_ip())
7     self.server_socket1 = socket.socket()
8     self.server_socket1.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEPORT, 1)
9     self.server_socket1.bind((HOST, 5000))
10    self.server_socket1.listen(1)
11    self.server_socket = socket.socket()
12    self.server_socket.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEPORT, 1)
13    self.server_socket.bind((HOST, 8000))
14    self.server_socket.listen(1)
15    print('Server address: ' +HOST)
16
17 def StopTcpServer(self):
18     try:
19         self.connection.close()
20         self.connection1.close()
21     except Exception, e:
22         print "No client connection"
23
24 def sendvideo(self):
25     try:
26         self.connection, self.client_address = self.server_socket.accept()
27         self.connection=self.connection.makefile('rb')
28     except:
29         pass
```

```
30     self.server_socket.close()
31     try:
32         with picamera.PiCamera() as camera:
33             camera.resolution = (400, 300)      # pi camera resolution
34             camera.framerate = 30              # 15 frames/sec
35             time.sleep(2)                      # give 2 secs for camera to initilize
36             start = time.time()
37             stream = io.BytesIO()
38             # send jpeg format video stream
39             print "Start transmit..."
40             for foo in camera.capture_continuous(stream, 'jpeg', use_video_port = True):
41                 try:
42                     self.connection.flush()
43                     stream.seek(0)
44                     b = stream.read()
45                     lengthBin = struct.pack('L', len(b))
46                     self.connection.write(lengthBin)
47                     self.connection.write(b)
48                     if time.time() - start > 600:
49                         break
50                     stream.seek(0)
51                     stream.truncate()
52                 except :
53                     print "End transmit..."
54                     break
55     except:
56         print "Camera unintall"
```

Open Server

If you are using **remote desktop mode** to login Raspberry Pi, you need use [VNC viewer](#).

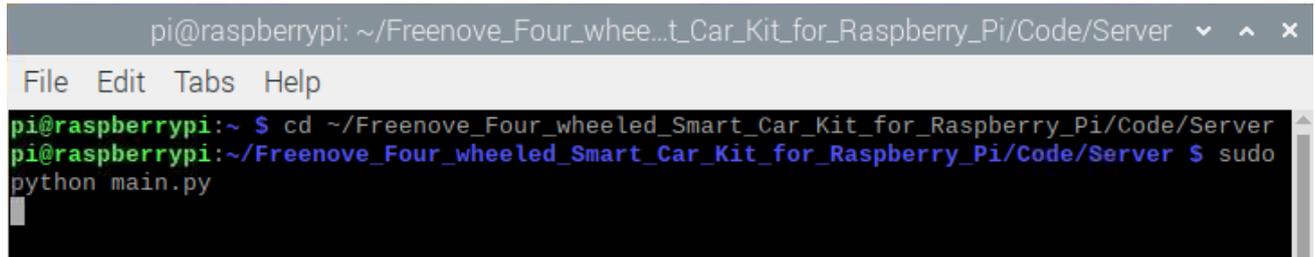

Enter following command in the terminal.

1. Use cd command to enter directory where main.py is located:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Run main.py:

```
sudo python main.py
```

```
pi@raspberrypi: ~/Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python main.py
```

The interface is as below:

Click "On" to open the server.

If you don't like interface, you can also enter the commands to open the server. It is more convenient.

1. Use cd command to enter directory where main.py is located:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Run main.py:

```
sudo python main.py -t -n
```

or Run main.py with following command:

```
sudo python main.py -tn
```

"-t" means open TCP communication. "-n" means don't show interface.

Client

The client connects to the server through TCP, which receives the video stream from the server, and other commands. And it also sends commands to the server to control the car.

Clients can run on different systems, such as windows, Linux, and so on. However, you need to install related software and libraries.

The related program is mainly in the Video.py file under the Client folder.

Part of client code is as below:

```

1  class VideoStreaming:
2      def __init__(self):
3          self.face_cascade = cv2.CascadeClassifier(r'haarcascade_frontalface_default.xml')
4          self.video_Flag=True
5          self.connect_Flag=False
6          self.face_x=0
7          self.face_y=0
8      def StartTcpClient(self, IP):
9          self.client_socket1 = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
10         self.client_socket = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
11     def StopTcpClient(self):
12         try:
13             self.client_socket.shutdown(2)
14             self.client_socket1.shutdown(2)
15             self.client_socket.close()
16             self.client_socket1.close()
17         except:
18             pass
19
20     def IsValidImage4Bytes(self, buf):
21         bValid = True
22         if buf[6:10] in (b'JFIF', b'Exif'):
23             if not buf.rstrip(b'\0\r\n').endswith(b'\xff\xd9'):
24                 bValid = False
25         else:
26             try:
27                 Image.open(io.BytesIO(buf)).verify()
28             except:
29                 bValid = False
30         return bValid
31
32     def face_detect(self, img):
33         if sys.platform.startswith('win'):
34             gray = cv2.cvtColor(img, cv2.COLOR_BGR2GRAY)

```

```
35         faces = self.face_cascade.detectMultiScale(gray, 1.3, 5)
36         if len(faces)>0 :
37             for (x, y, w, h) in faces:
38                 self.face_x=float(x+w/2.0)
39                 self.face_y=float(y+h/2.0)
40                 img = cv2.circle(img, (x+w/2, y+h/2), (w+h)/4, (0, 255, 0), 2)
41             else:
42                 self.face_x=0
43                 self.face_y=0
44         cv2.imwrite('video.jpg', img)
45
46     def streaming(self, ip):
47         stream_bytes = b''
48         try:
49             self.client_socket.connect((ip, 8000))
50             self.connection = self.client_socket.makefile('rb')
51         except:
52             #print "command port connect failed"
53             pass
54         while True:
55             try:
56                 stream_bytes= self.connection.read(4)
57                 leng=struct.unpack('L', stream_bytes[:4])
58                 jpg=self.connection.read(leng[0])
59                 if self.IsValidImage4Bytes(jpg):
60                     image = cv2.imdecode(np.frombuffer(jpg, dtype=np.uint8),
61 cv2.IMREAD_COLOR)
62                     if self.video_Flag:
63                         self.face_detect(image)
64                         self.video_Flag=False
65             except:
66                 break
```

Run client on windows system

This section will be completed in your **computer with windows system, not Raspberry Pi.**

There are many relevant software and libraries needed to be installed in Windows system, which takes a long time. At this time, it does not need to run Server and use Raspberry Pi. You can shut down Raspberry Pi first. After the installation is completed, you need to open Raspberry Pi and server again.

Install python3

Download the installation file:

<https://www.python.org/downloads/windows/>

Python >>> Downloads >>> Windows

Python Releases for Windows

- [Latest Python 3 Release - Python 3.8.1](#)
- [Latest Python 2 Release - Python 2.7.17](#)

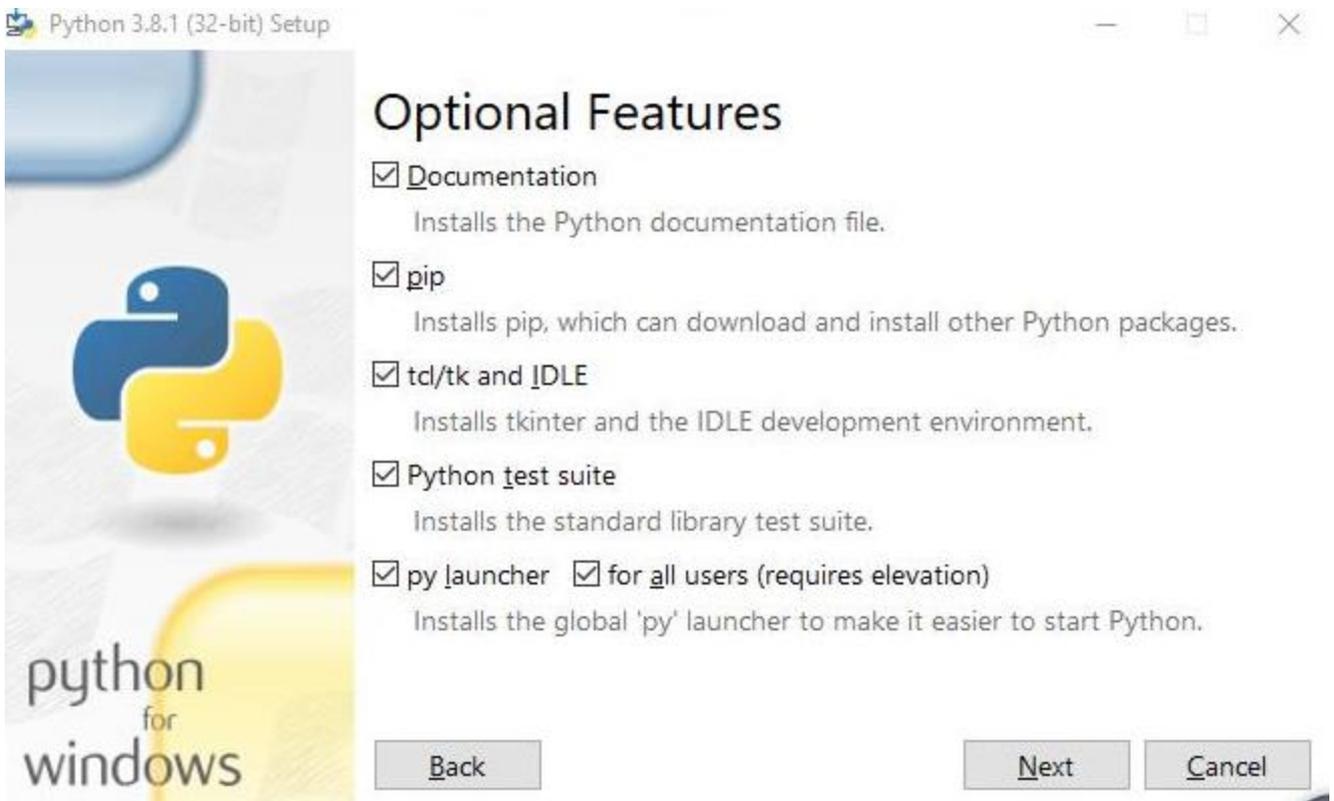

Click Latest Python 3 Release - Python 3.8.1

Version	Operating System	Description
Gzipped source tarball	Source release	
XZ compressed source tarball	Source release	
macOS 64-bit installer	Mac OS X	for OS X 10.9 and later
Windows help file	Windows	
Windows x86-64 embeddable zip file	Windows	for AMD64/EM64T/x64
Windows x86-64 executable installer	Windows	for AMD64/EM64T/x64
Windows x86-64 web-based installer	Windows	for AMD64/EM64T/x64
Windows x86 embeddable zip file	Windows	
Windows x86 executable installer	Windows	
Windows x86 web-based installer	Windows	

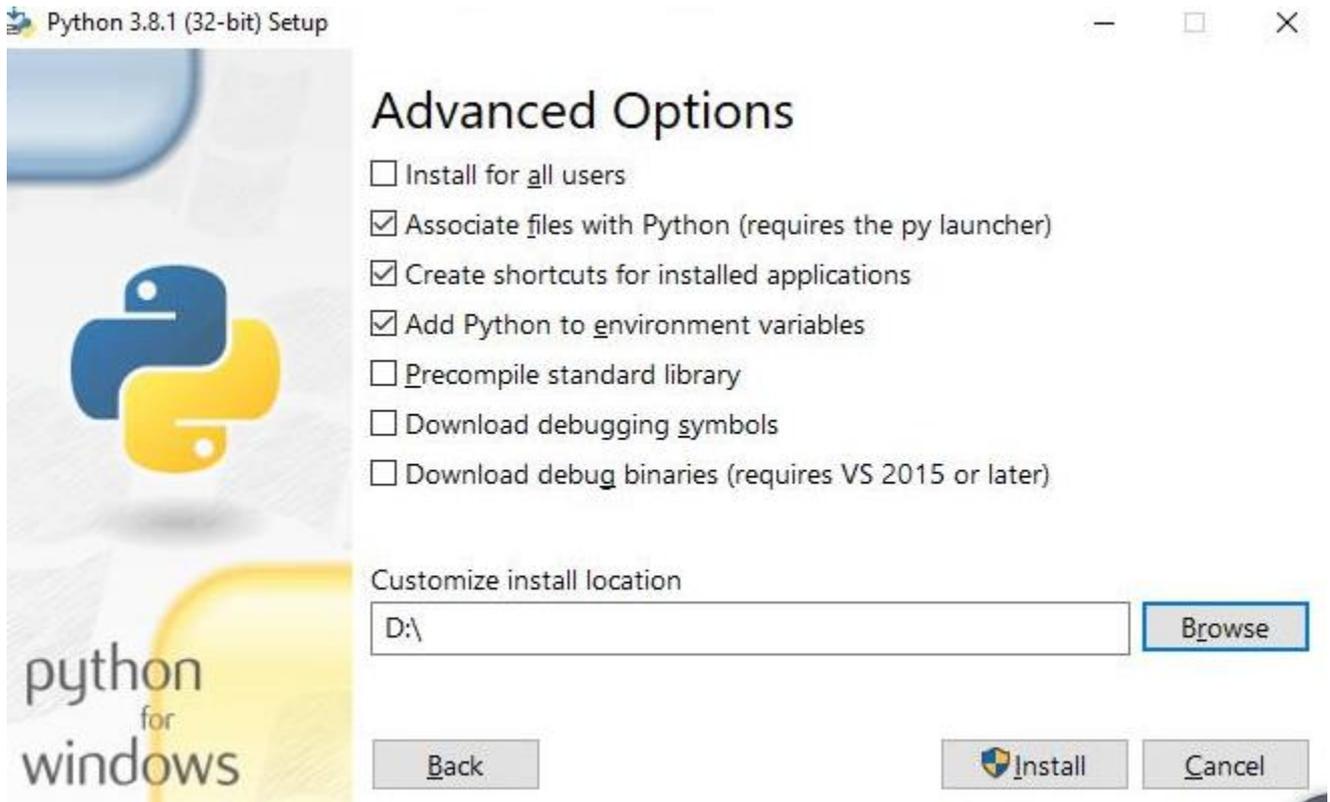

Choose and download Windows x86 executable installer. After download successfully, install it.

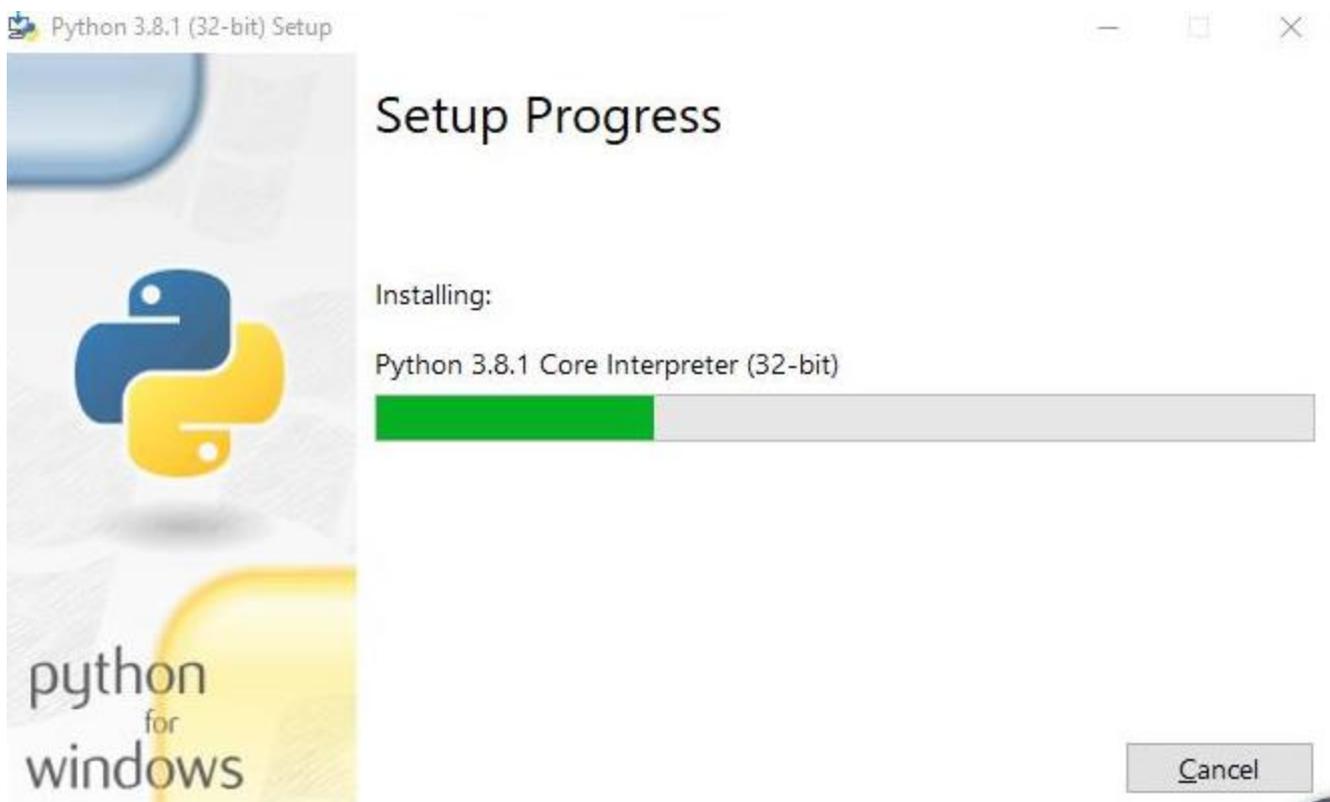

Select "Add Python 3.8 to PATH". You can choose other installation features.

Select all options and click "Next".

Here, my install location is D. You can also choose other location. Then click "Install".

Wait installing.

Now, installation is completed.

Install [PyQt5](#), [opencv](#), [numpy](#) and other libraries.

If have not download the zip file, download it via below:

https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/archive/master.zip

Then unzip it and delete "-master" to rename it to "Freenove_Robot_Dog_Kit_for_Raspberry_Pi".

Then put it into D disk for example.

You can also place it into other disks (like E), but the path in following command should be modified accordingly (replace D: by E:).

Press "win + R" and enter cmd, and click ok. Then enter following commands.

1. Enter D disk. (If you put it into E, it should be E:)

```
D:
```

2. Enter directory where setup_windows.py is located: (If you put it into E, it should be E:)

```
cd D:\Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code
```

3. Run setup_windows.py:

```
Python3 setup_windows.py
```

```
C:\Users\Freenove>D:
```

```
D:\>cd D:\Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code
```

```
D:\Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code>Python3 setup_windows.py
```

Or enter the unzipped directory Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code\Client.

And double-click **setup_client.py** or open it with python3.

Installation will take some time. Just wait patiently. For successful installation, it will prompt "All libraries installed successfully":

```
Package      Version
-----
Click        7.0
numpy        1.18.1
opencv-python 4.1.2.30
Pillow       7.0.0
pip          19.2.3
PyQt5        5.13.2
PyQt5-sip    12.7.0
pyqt5-tools  5.13.2.1.6rc1
python-dotenv 0.10.3
setuptools   41.2.0
```

If not all installations are successful, it will prompt "Some libraries have not been installed yet. Please run ' Python3 setup_windows.py ' again", then you need to execute the Python3 setup_windows.py command again. Most of the installation failures are caused by bad networks. You can check your network before installing.

Open client

Press "win + R" and enter cmd, and click ok. Then enter following commands.

1. Enter D disk. If you put it into E, it should be E:

```
D:
```

2. Enter directory where Main.py is located:

```
cd D:\Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code\Client
```

3. Run Main.py:

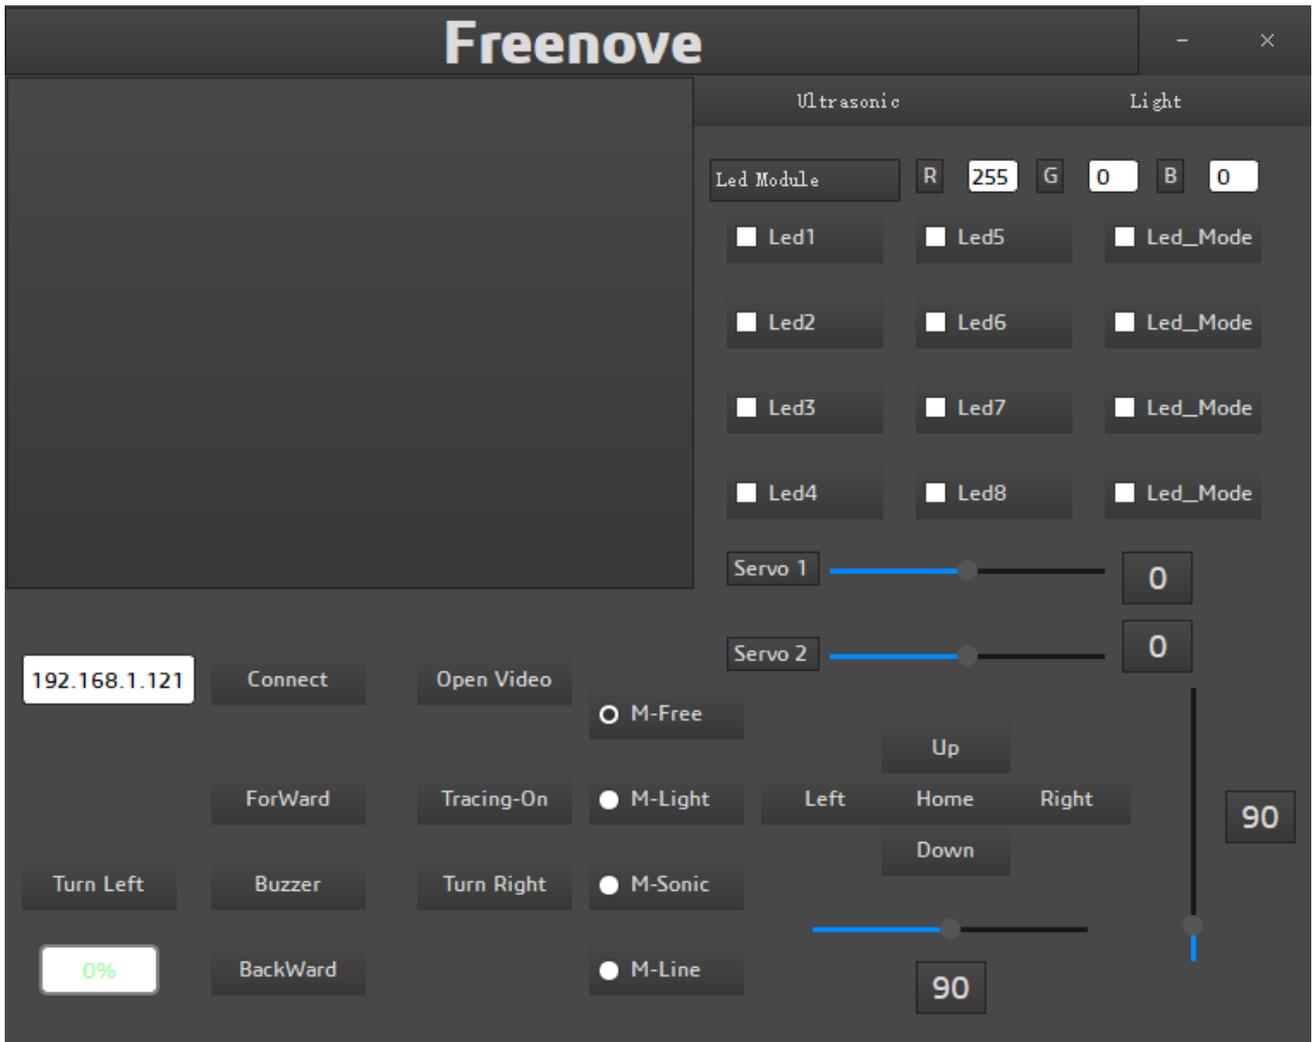

```
python Main.py
```

```
C:\Users\Freenove>D:
D:\>cd D:\Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi\Client
D:\Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi\Client>python Main.py_
```

Or enter the unzipped directory and enter following directory:

Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code\Client. And double-click **Main.py** or open it with python to open the client.

The client interface is shown as below:

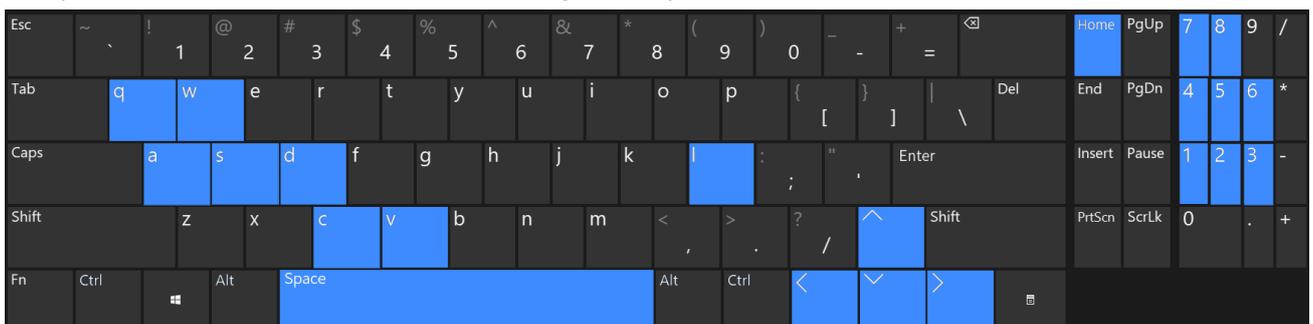

After the client opens successfully, you need open the Raspberry Pi and **open server first**, then enter the IP address of the Raspberry Pi in the white IP edit box, and then click “Connect” to connect smart car to Raspberry Pi. After the connection is successful, you can click on the controls on the interface to operate the car.

Note: when Raspberry Pi is shut down, server will be closed. You need open server again the next time.

If pressing forward the car move backward, please refer to page 51 to modify the code.

Control

And you can also control the car with following blue keys.

The car has four work modes:

Mode	Function
M-Free (Mode1)	Free control mode
M-Light (Mode2)	Light tracing mode
M-Sonic (Mode3)	Ultrasonic obstacle avoidance mode
M-Line (Mode4)	Infrared line tracking mode

The following is the corresponding operation of the buttons and keys.

Button on Client	Key	Action
ForWard	W	Move
BackWard	S	Back off
Turn Left	A	Turn left
Turn Right	D	Turn right
Left	left arrow	Turn camera left
Right	right arrow	Turn camera right
Up	up arrow	Turn camera up
Down	down arrow	Turn camera down
Home	Home	Turn camera back Home
Connect/ Disconnect	C	On/off Connection
Open Video/ Close Video	V	On/off Video
Mode 1,2,3,4	Q	Switch Mode
Buzzer	Space	On/off Buzzer
Led 1,2,3,4,5,6,7,8	1,2,3,4,5,6,7,8	On/off Led 1,2,3,4,5,6,7,8
Led_Mode 1,2,3,4	L	Switch Led Mode

The function of SliderBar is below:

SliderBar	Function
Servo 1,2,	SliderBar Servo 1, 2 are used for angle fine tuning. If the servo is not fully centered during installation, you can fine tune it via the SliderBar.

Other control information:

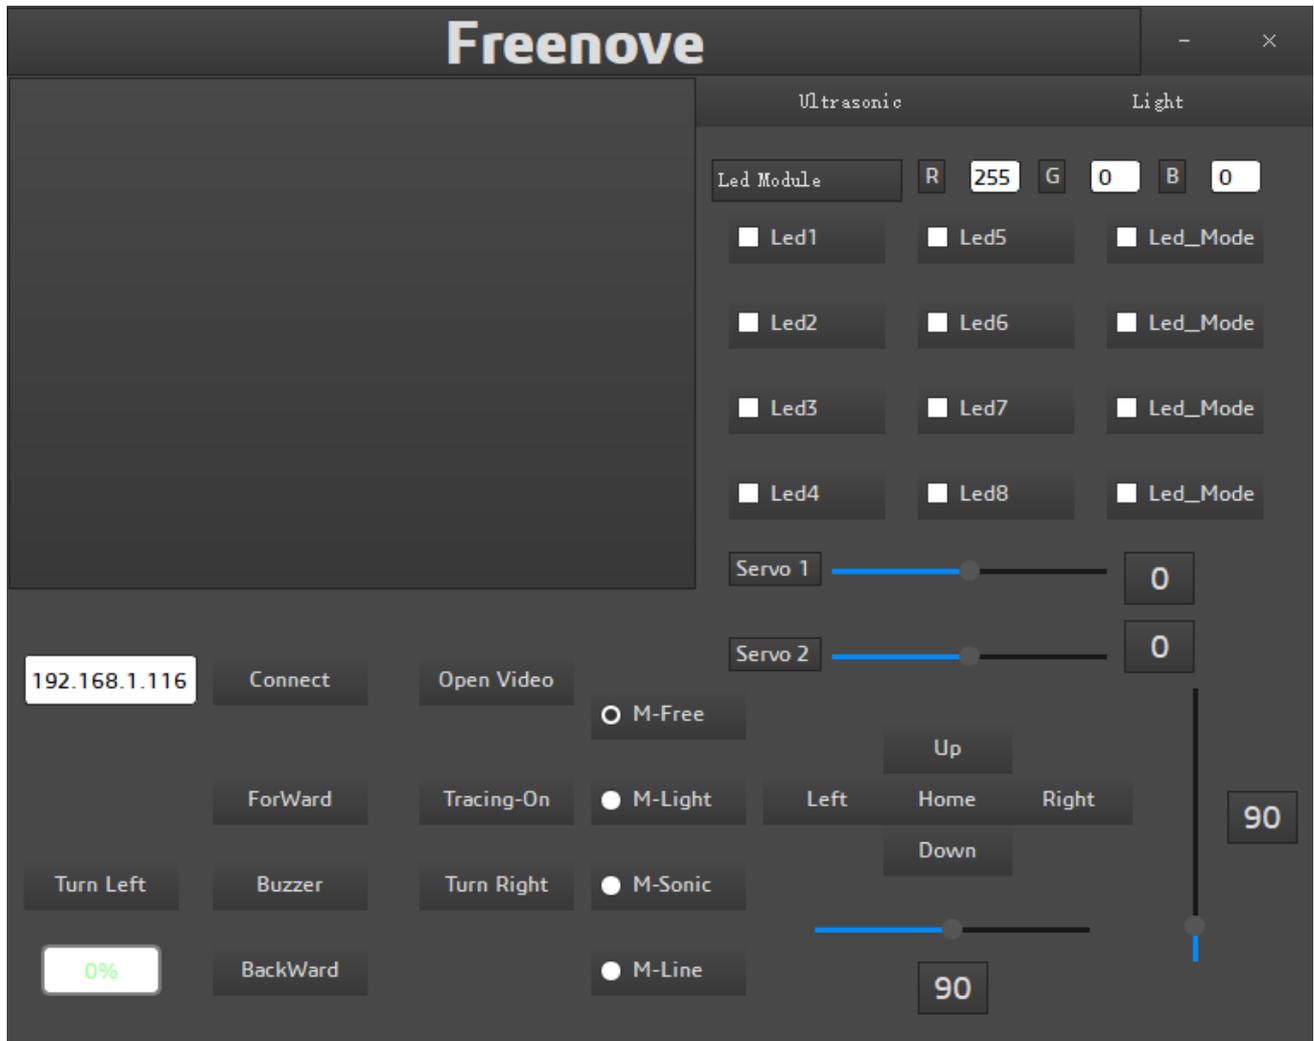

Control	Function
IP address Edit box	Enter IP address of Raspberry Pi
Power box	Show power level
R,G,B Edit box	Control the color of LED selected.
Button "Ultrasonic"	Show the distance from obstacle.
Button "Light "	Show voltage of two photoresistors.
Button "Tracing-On/Off "	Open and close face tracking

If you don't want to enter IP address after open the client, you can make some modification below:

1. Open "Client_Ui.py" under directory "Client", then find code in the thirty-sixth line from the bottom.
2. Modify IP address to IP address of your raspberry pi. For example, my rpi IP is 192.168.1.116. After modification, it should be below:

```
self.IP.setText(_translate("Client", "192.168.1.116", None))
```

Then save and close. Then restart your client. You can see it is modified successfully.

Run client on macOS system

Here take MacOS 10.13 as an example. To run the client on MacOS, you need to install some software and libraries. At this time, it does not need to run the server and use the Raspberry Pi. So you can turn off the Raspberry Pi first. After the installation is complete, turn on the Raspberry Pi and run the server. MacOS 10.13 comes with python2, but no python3. The programs in this project need run under python3.

Install python3

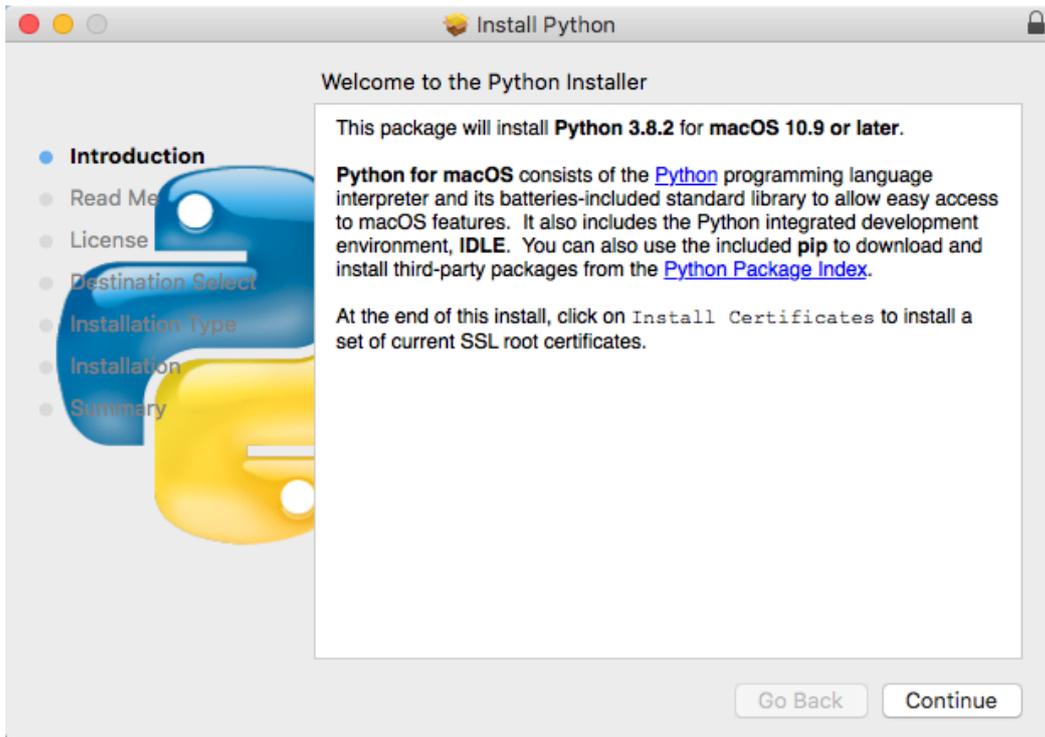

Download installation package, link: <https://www.python.org/downloads/>

Release version	Release date	
Python 3.8.2	Feb. 24, 2020	 Download
Python 3.8.1	Dec. 18, 2019	 Download
Python 3.7.6	Dec. 18, 2019	 Download
Python 3.6.10	Dec. 18, 2019	 Download
Python 3.5.9	Nov. 2, 2019	 Download
Python 3.5.8	Oct. 29, 2019	 Download

Click Python 3.8.2.

Version	Operating System	Description
Gzipped source tarball	Source release	
XZ compressed source tarball	Source release	
macOS 64-bit installer	Mac OS X	for OS X 10.9 and later
Windows help file	Windows	
Windows x86-64 embeddable zip file	Windows	for AMD64/EM64T/x64
Windows x86-64 executable installer	Windows	for AMD64/EM64T/x64
Windows x86-64 web-based installer	Windows	for AMD64/EM64T/x64
Windows x86 embeddable zip file	Windows	
Windows x86 executable installer	Windows	
Windows x86 web-based installer	Windows	

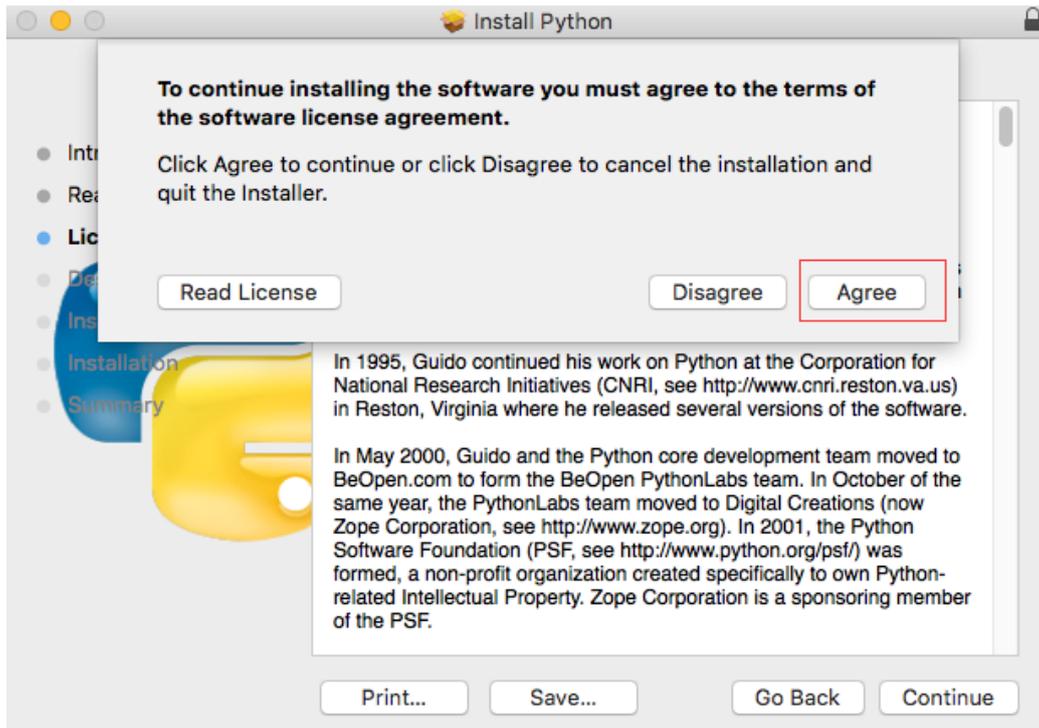

At bottom of the page, click macOS 64-bit installer and download installation package.

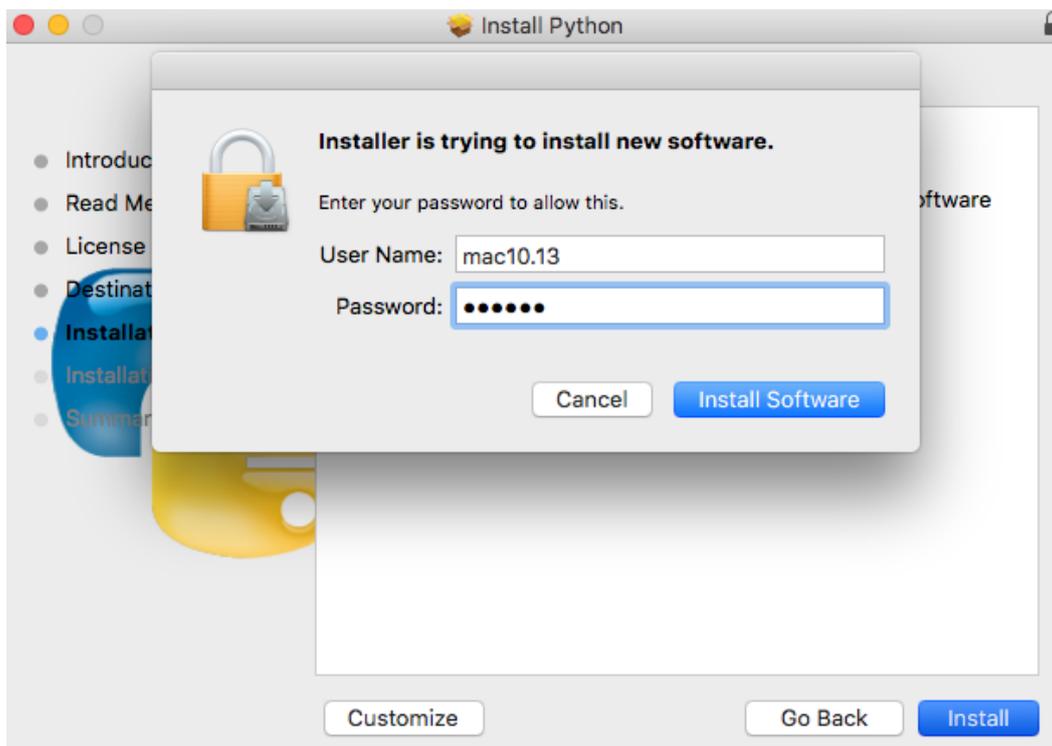

Click Continue.

Click Continue

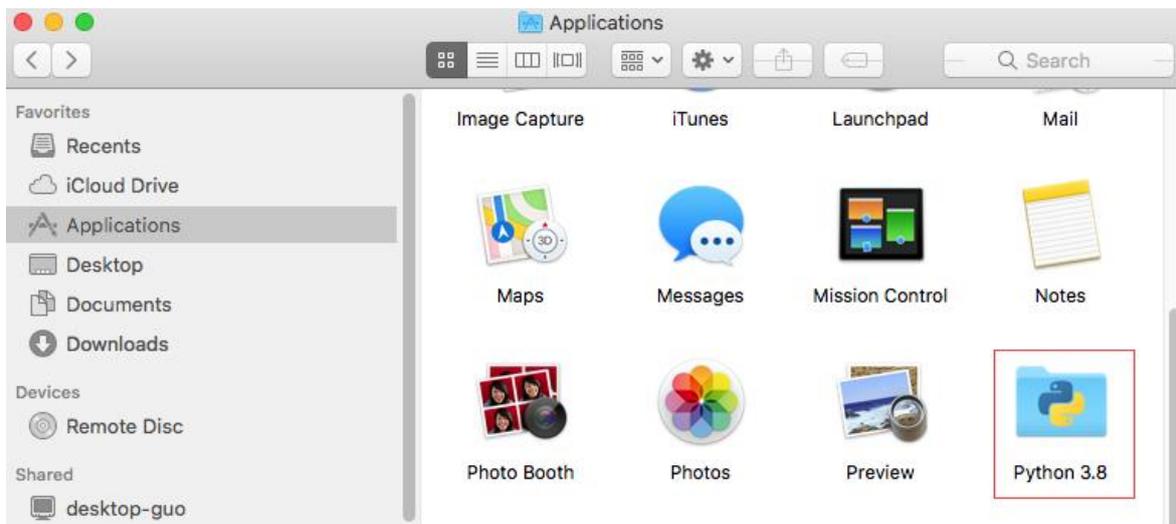

Click Agree.

Click Install. If your computer has a password, enter the password and Install Software.

Now the installation succeeds.

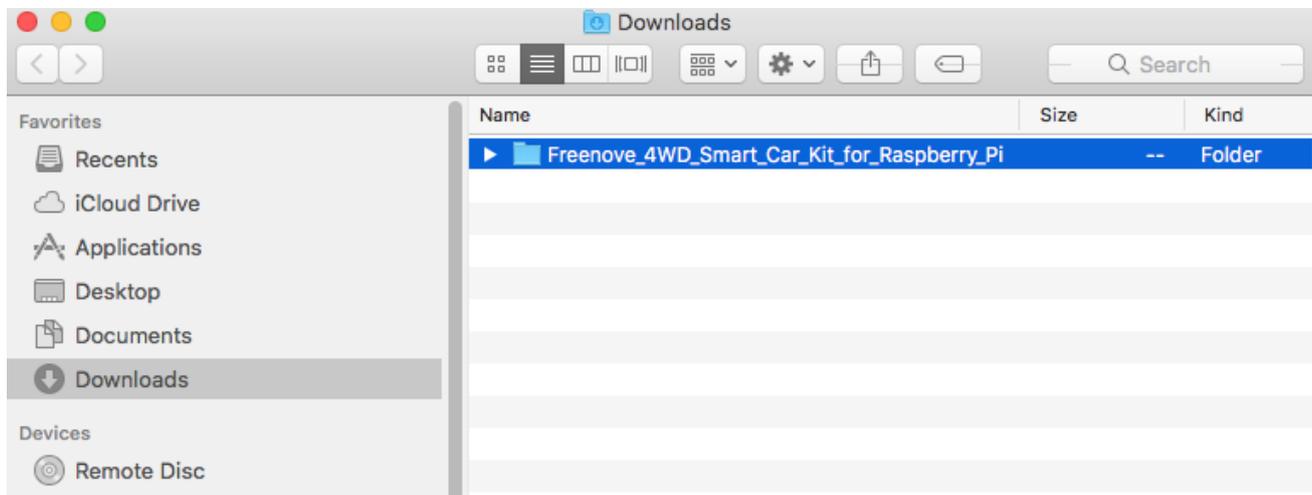

You can find it under Applications.

Install PyQt5, opencv, numpy and other libraries

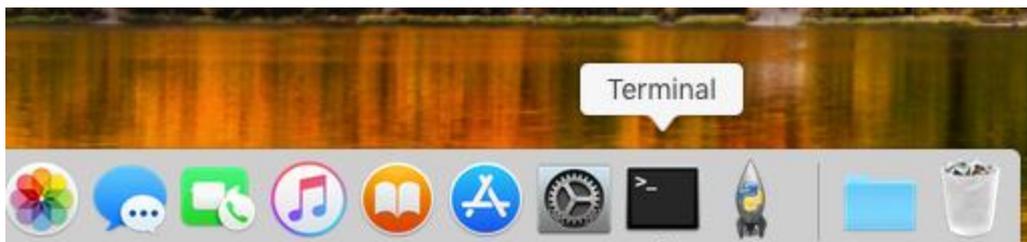

If there is no code for this car in your macOS system device, you can download it via the link below:

https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/archive/master.zip

After downloaded successfully, you can find it under Downloads.

Open the Terminal.

Type following commands in Terminal.

1. Enter "Downloads", (Where the Car code is located. If your location for it is different, please enter the location in your device.)

```
cd Downloads
```

2. Enter directory where setup_macos.py is located:

```
cd Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/
```

3. Run setup_macos.py:

```
python3 setup_macos.py
```

```

Code — Python • Python setup_macos.py — 86x24
Last login: Mon Mar  2 18:56:17 on ttys000
[mac13deMac:~ mac10.13$ cd Downloads
[mac13deMac:Downloads mac10.13$ cd Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/
[mac13deMac:Code mac10.13$ python3 setup_macos.py

```

Installation will take some time. Just wait patiently. For successful installation, it will prompt "All libraries installed successfully":

```
Package            Version
-----
numpy              1.18.1
opencv-python-headless 4.2.0.32
Pillow            7.0.0
pip               20.0.2
PyQt5             5.14.1
PyQt5-sip        12.7.1
setuptools        41.2.0
```

```
All libraries installed successfully
mac13deMac:Code mac10.13$
```

If not all installations are successful, it will prompt "Some libraries have not been installed yet. Please run 'python3 setup_macos.py' again", then you need to execute the python3 setup_macos.py command again. Most of the installation failures are caused by bad networks. You can check your network before installing.

Open client

Following the previous step, after the installation is completed, you are now in the directory where `setup_macos.py` is located.

Package	Version
numpy	1.18.1
opencv-python-headless	4.2.0.32
Pillow	7.0.0
pip	20.0.2
PyQt5	5.14.1
PyQt5-sip	12.7.1
setuptools	41.2.0

All libraries installed successfully

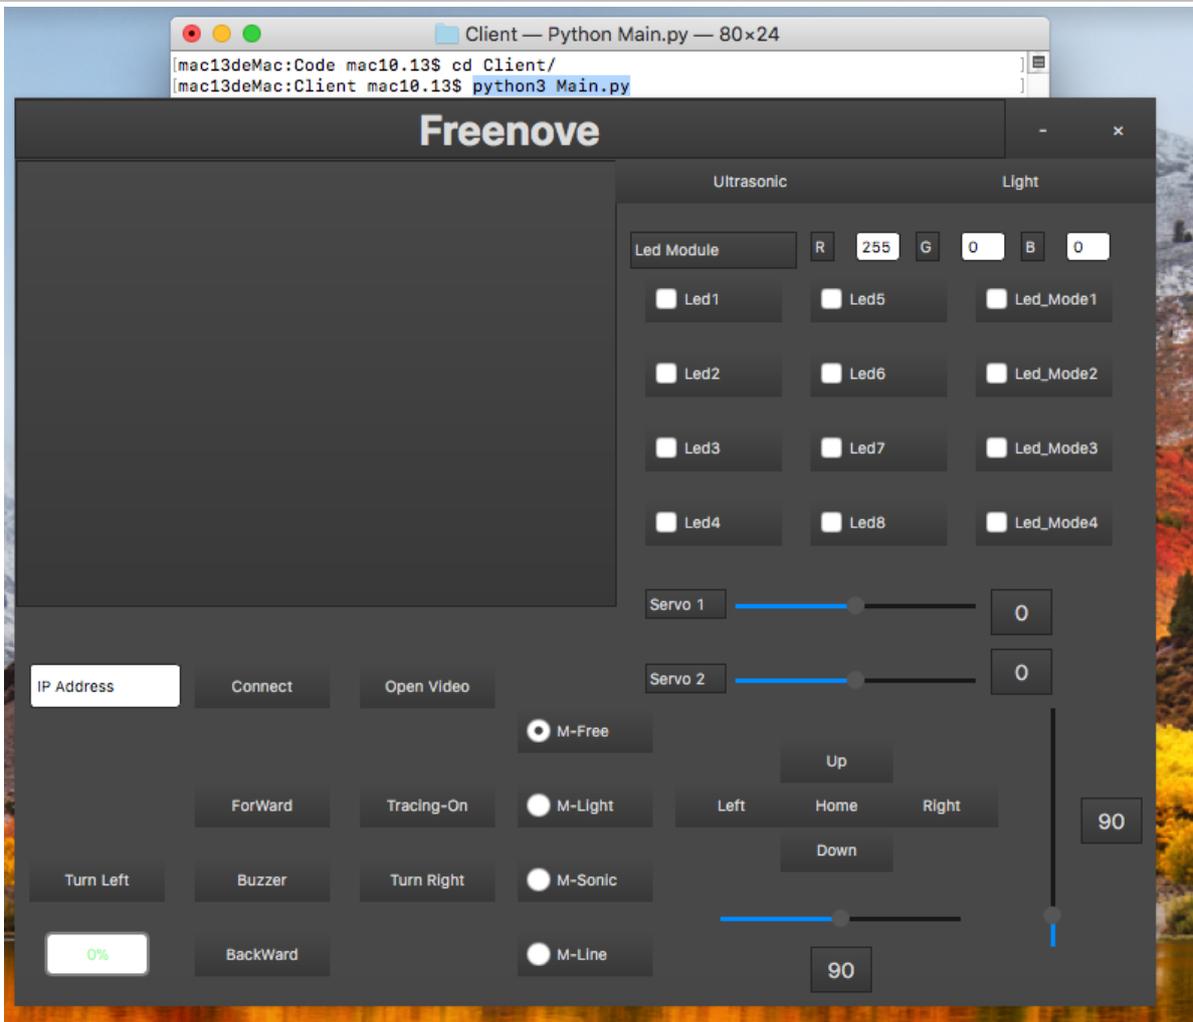

```
mac13deMac:Code mac10.13$
```

1.Type following command to enter Client folder.

```
cd Client/
```

2.Type following command to run Main.py.

```
python3 Main.py
```

The control way of Raspberry Pi macOS System client is same with Windows ([Control](#)).

Run client in Raspberry Pi (Linux system)

Run client

Enter the following commands at the terminal.

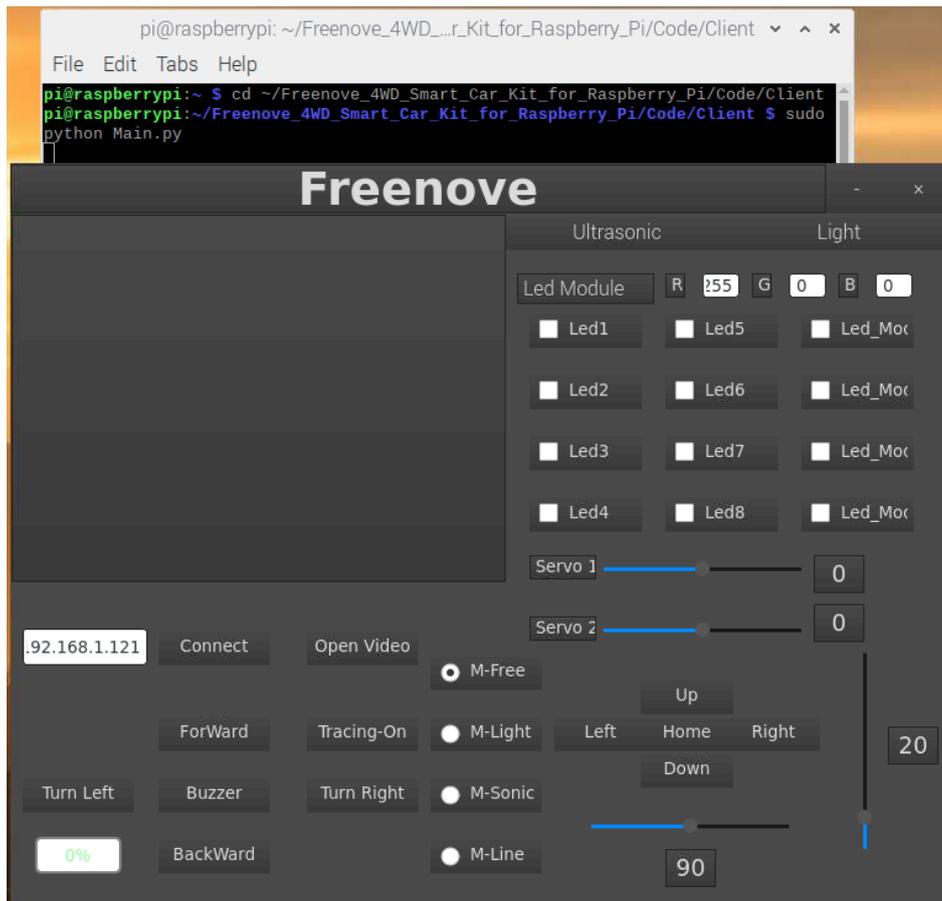

1. Use the cd command to go to the directory where Main.py is located.

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Client
```

2. Run Main.py:

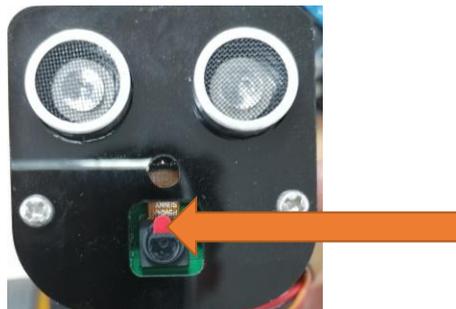

```
sudo python Main.py
```

The interface is shown below:

The control mode of client on Linux is the same as that of Windows, but it does not have the function of face detection and tracking.

If the image is not clear, please check whether the camera protective film is torn off.

If the car works abnormal, it may be caused by following reasons: raspberry pi system is stuck or batteries have no power.

You need check batteries power indicator or recharge batteries. Make sure batteries have enough power. When the batteries voltage is less than 7V, the buzzer will make regular sound.

If the batteries is OK, raspberry pi system is stuck. You need wait some time to check if the client works. Or reopen the server and client.

The new latest Raspberry Pi official system is not stable. It occasionally is stuck. The old version is more stable.

If the raspberry pi system is stuck for a long time, you need reboot raspberry pi.

If you have any concerns, please feel free to contact us with pictures: support@freenove.com

Android app

You can download and install the Freenove Android app from below:

On Google play:

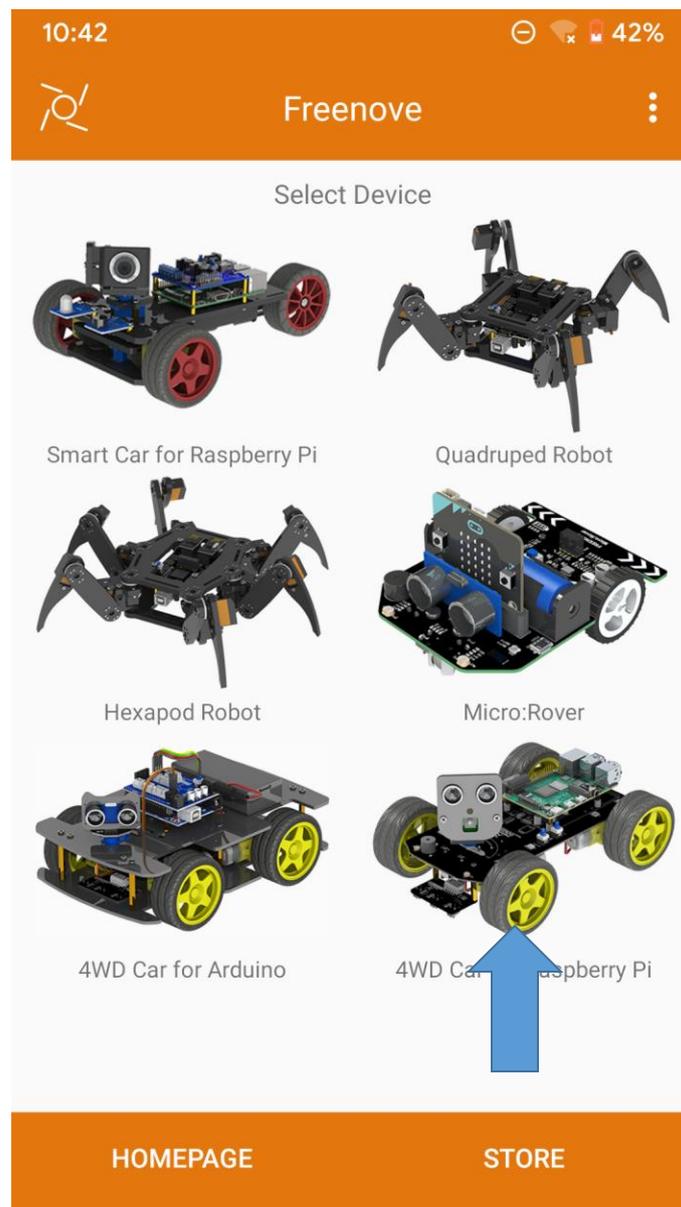

<https://play.google.com/store/apps/details?id=com.freenove.suhayl.Freenovez>

On GitHub:

https://github.com/Freenove/Freenove_App_for_Android

In this github repository, you can find the App instruction (Tutorial.pdf).

Open the app and select the car.

Open the server in Raspberry Pi car first. And enter your Pi IP.

The screenshot shows a control interface for a Raspberry Pi car. At the top left, a callout box labeled "Raspberry Pi IP" points to the IP address "192.168.4.1". Below the IP are two icons: a USB icon labeled "Connec" and a gear icon labeled "Set". In the center is a 3D rendering of the car. To the right, there are several control icons: a camera icon labeled "Take photos", a speaker icon labeled "Buzzer", and a color wheel icon labeled "RGB led". Below these are five directional arrow icons (up, down, left, right, and a central circle) with a callout box explaining their function. At the bottom left, a circular area with a central blue dot is labeled "Control Car moving. Drag the middle dot to any where in the area." At the bottom right, a callout box explains the directional icons: "Control camera angle and position. The ring in the middle is use to reset."

Raspberry Pi IP

192.168.4.1

Connec

Set

Take photos

Buzzer

RGB led

0.00V 00.00fps

Control Car moving.
Drag the middle dot to any where in the area.

Control camera angle and position.
The ring in the middle is use to reset.

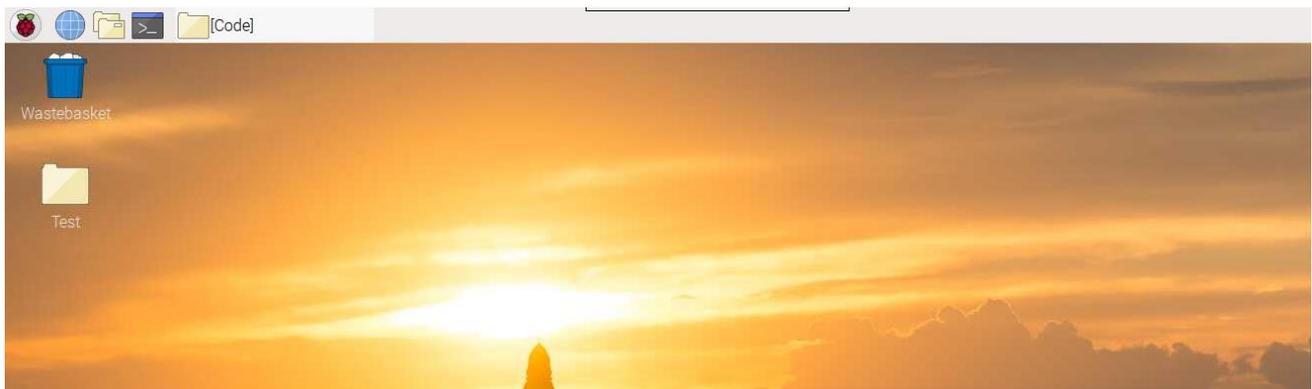

Free innovation

If you have any concerns, please feel free to contact us via support@freenove.com

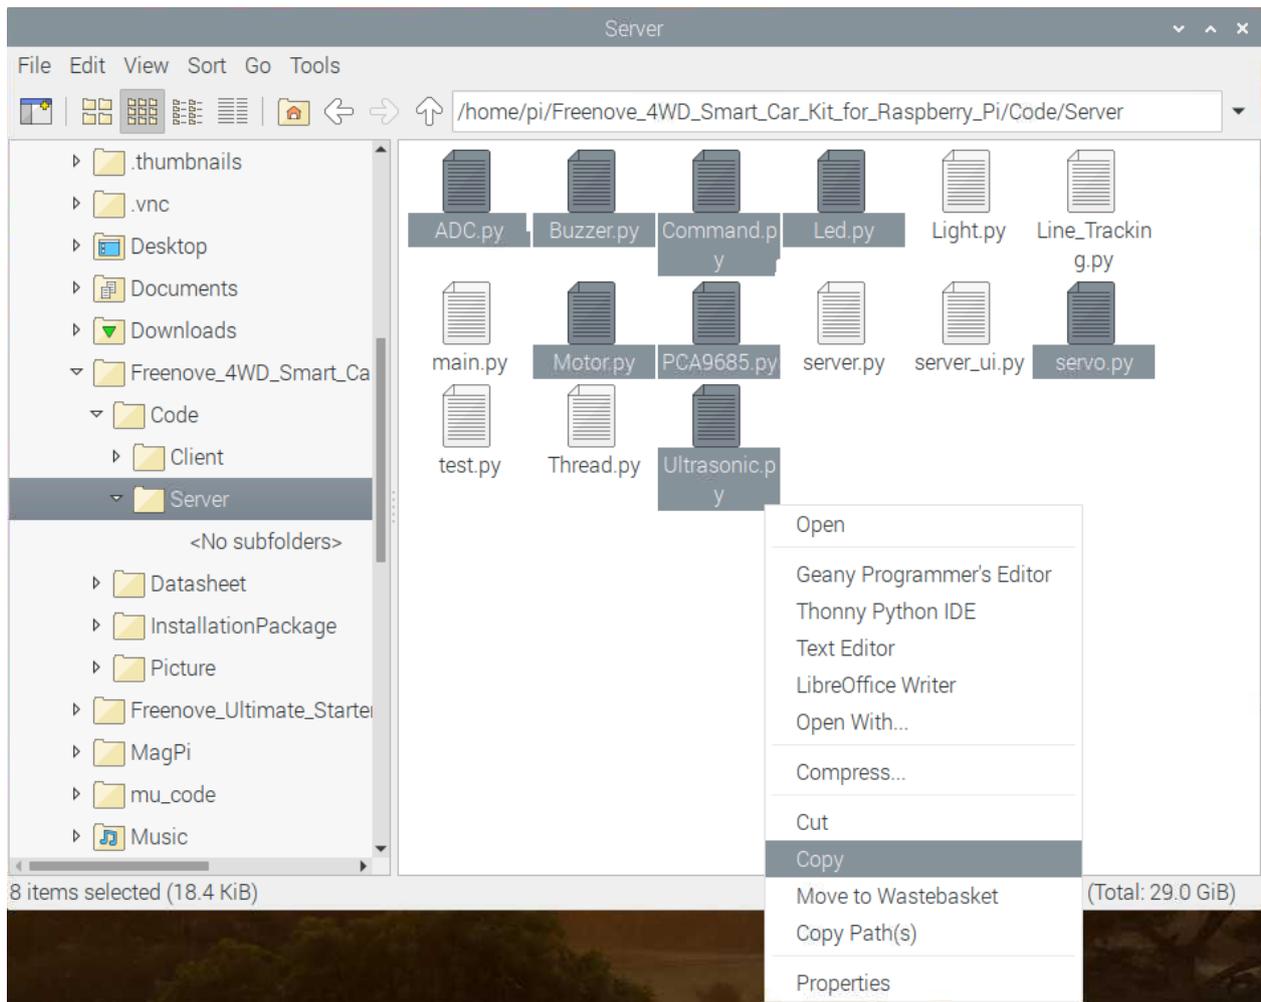

If you want to write your own program to control the car, just follow this section. We will teach you how to program this car.

If you have never learned python before, you can learn some basic knowledge via the link below:
<https://python.swaroopch.com/basics.html>

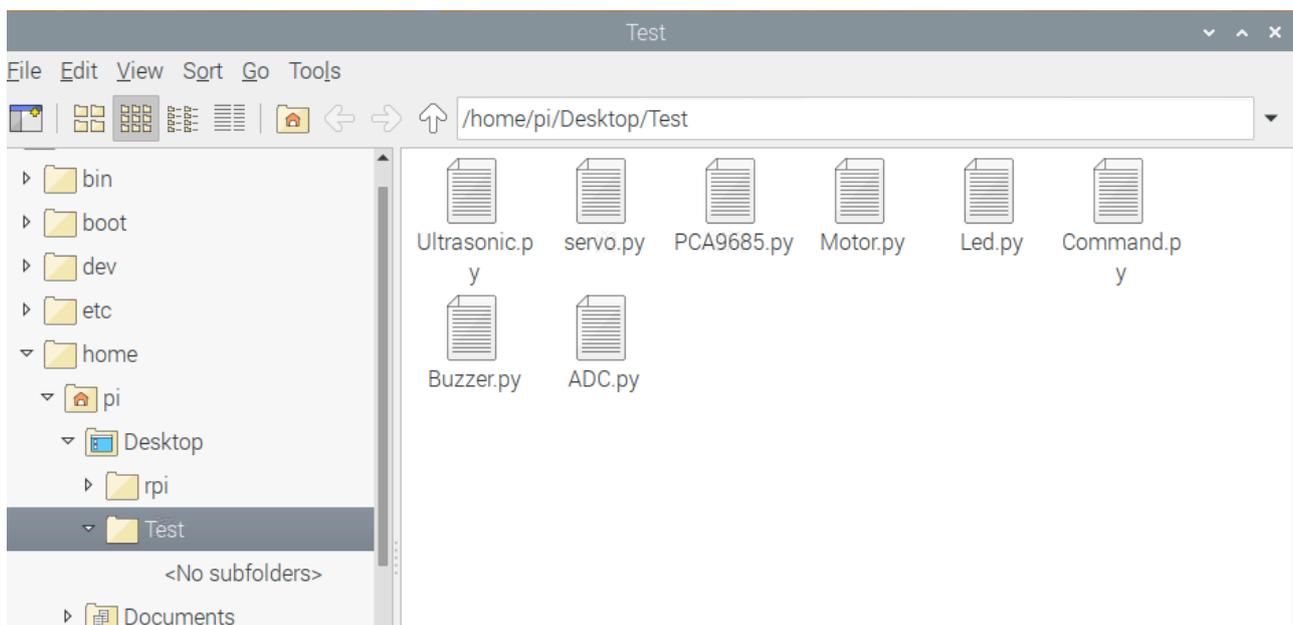

First, turned on S1 and S2. Then open Raspberry Pi, right click and create a new folder on the desktop: Test

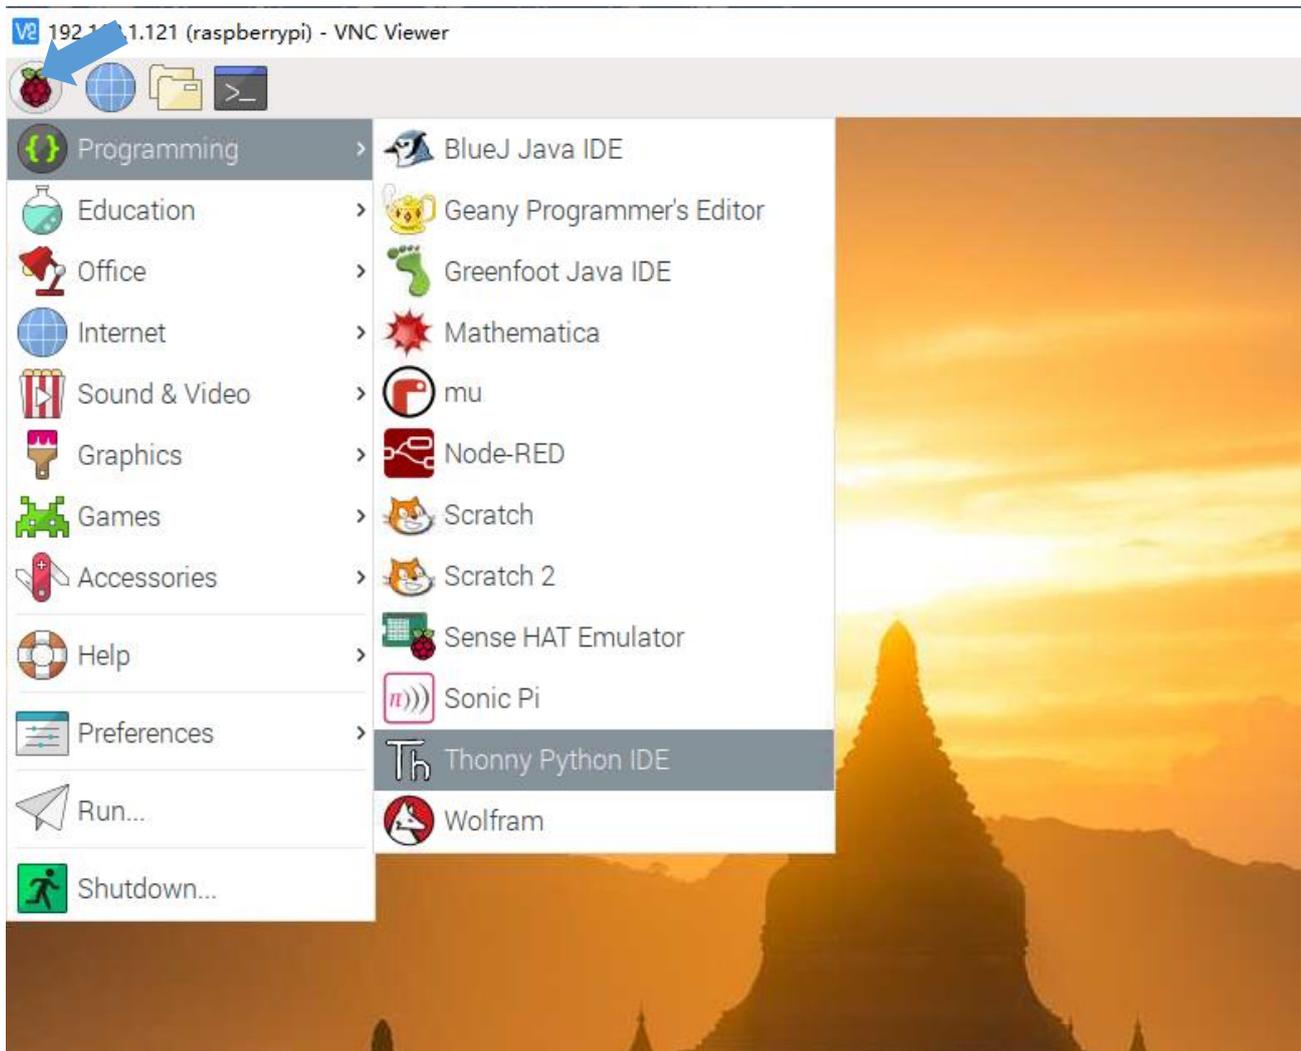

Open `Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server` in your Raspberry Pi and cope following **8 files** into the Test folder we created.

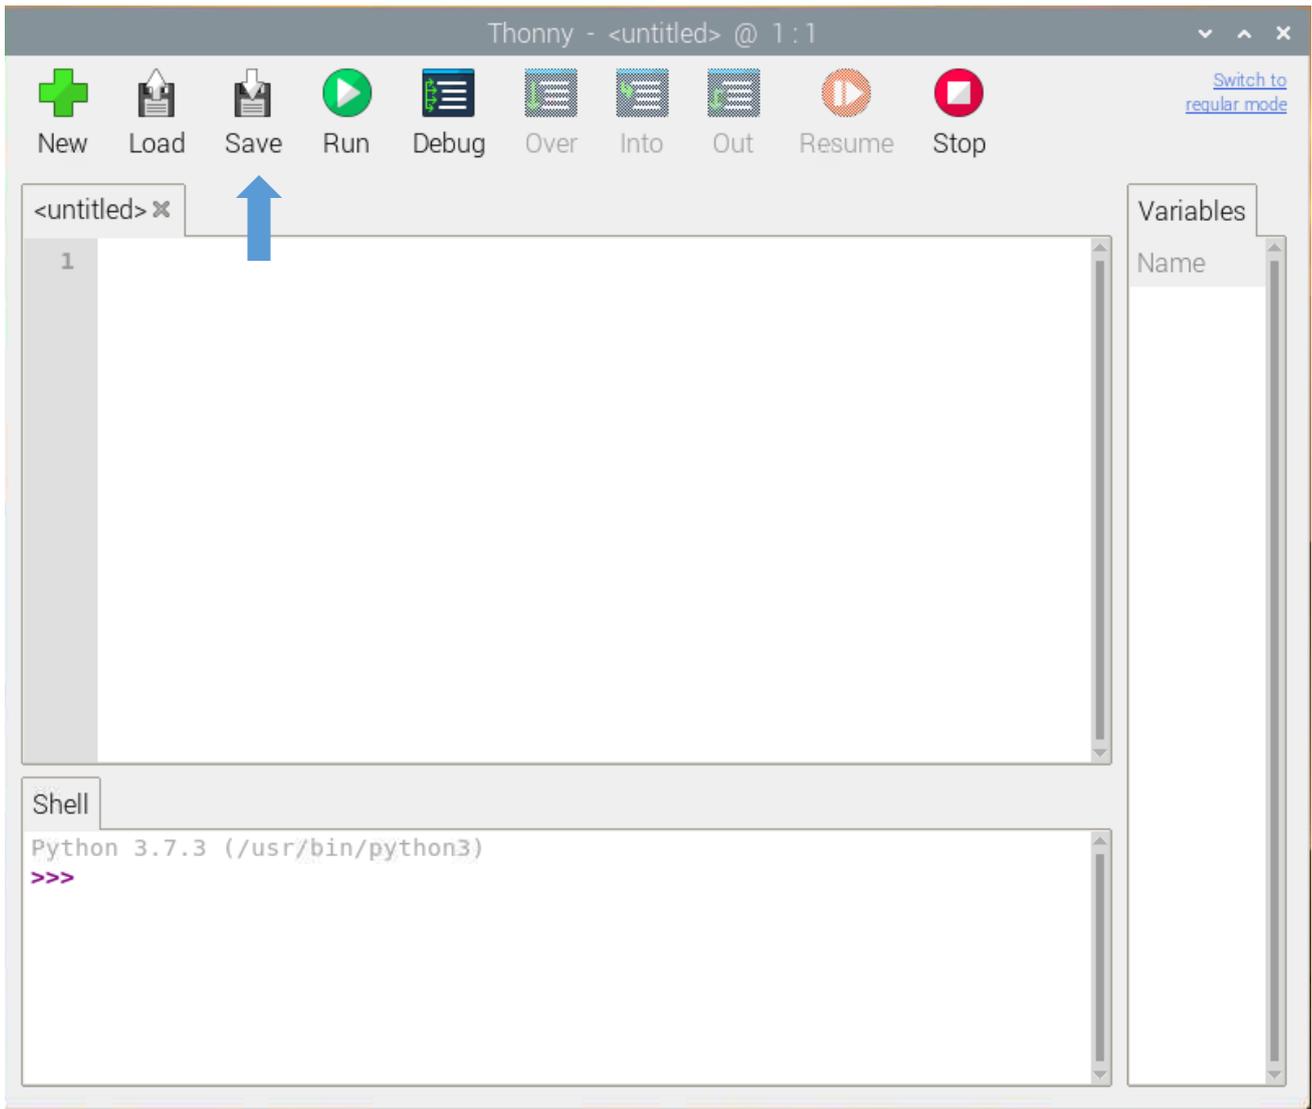

Paste them in Test folder.

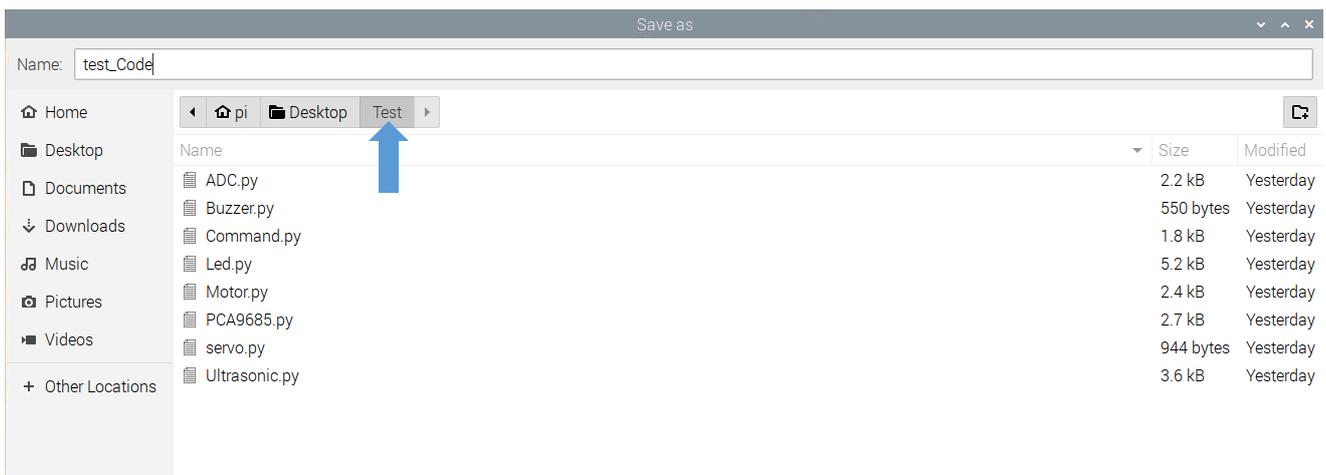

Run Thonny Python IDE

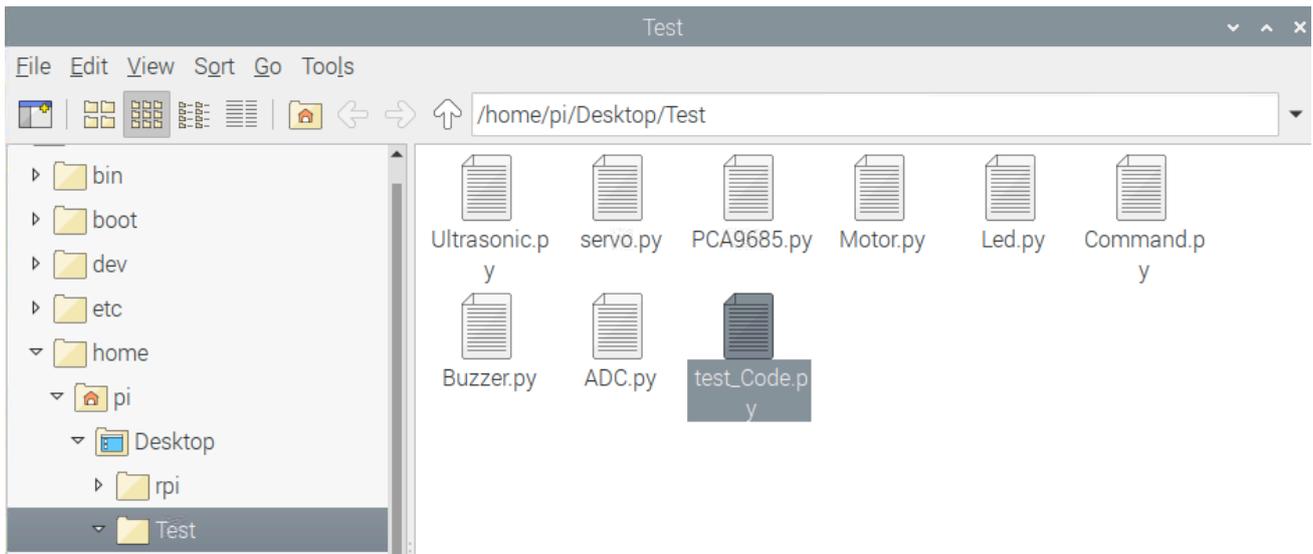

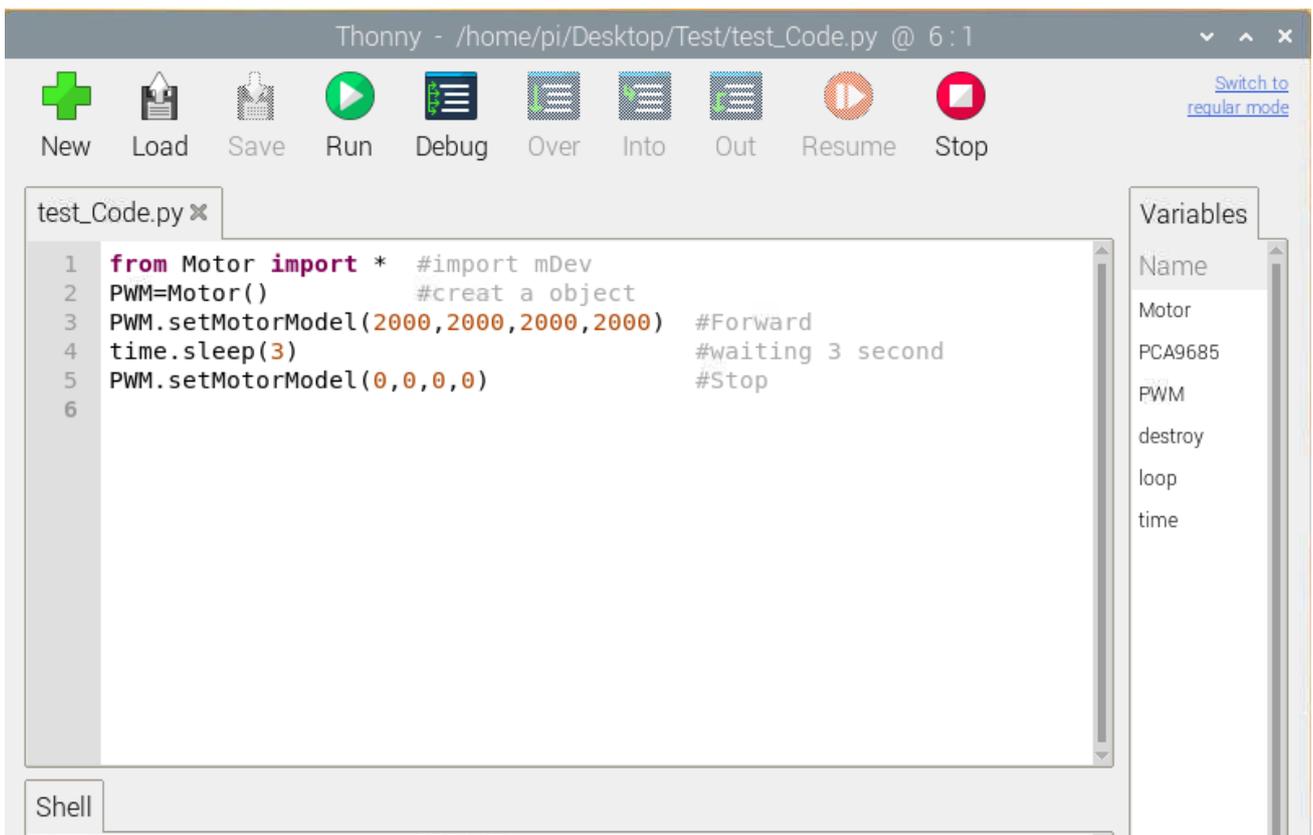

Click Save and save it into the Test folder, with name: test_Code.

Now you can see the file test_Code.py we created.

Then write code in test_Code.py, then click save.

Note: the code and library are written by **Python 3**. You need execute the code with **python 3**.

Open the terminal and use following command to enter the directory where test_Code.py is located:

```
cd ~/Desktop/Test
```

Run test_Code.py:

```
sudo python test_Code.py
```

```
pi@raspberrypi: ~/Desktop/Test
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Desktop/Test
pi@raspberrypi:~/Desktop/Test $ sudo python test_Code.py
```

Code example

Following are code example for the parts. For more detail, please refer to [Module test section](#).

For more details, please refer to [Motor](#).

```
1 from Motor import *           #import Motor
2 PWM=Motor()                  #create an object
3 PWM.setMotorModel(2000,2000,2000,2000) #Forward
4 time.sleep(3)                #waiting 3 second
5 PWM.setMotorModel(0,0,0,0)   #Stop
```

ADC. For more details, please refer to [ADC](#).

```
1 from ADC import *           #import ADC
2 adc=Adc()                   #create an object
3 Left_IDR=adc.recvADC(0)     #get value
4 print("The photoresistor voltage on the left is "+str(Left_IDR)+"V")
```

LED. For more details, please refer to [LED](#).

```
1 from Led import *           #import Led
2 led=Led()                   #create an object
3 led.ledIndex(0x04,255,255,0) #yellow
4 led.ledIndex(0x80,0,255,0)   #green
5 time.sleep(5)                #wait 5s
6 led.colorWipe(led.strip,Color(0,0,0)) #turn off
```

Buzzer. For more details, please refer to [Buzzer](#).

```
1 from Buzzer import *           #import Led
2 from Command import COMMAND as cmd #import Led
3 buzzer=Buzzer()               #create an object
4 buzzer.run('1')               #Start
5 time.sleep(3)                 #wait 3s
6 buzzer.run('0')               #Stop
```

Servo. For more details, please refer to [Servo](#).

```
1 from servo import *           #import Led
2 pwm = Servo()                 #create an object
3 #Servo rotates from 30 degrees to 150 degrees
4 for i in range(30, 150, 1) :
5     pwm.setServoPwm('0', i)
6     time.sleep(0.01)
7 #Servo rotates from 150 degrees to 0 degrees
8 for i in range(150, 30, -1) :
9     pwm.setServoPwm('0', i)
10    time.sleep(0.01)
```

Ultrasonic module. For more details, please refer to [Ultrasonic module](#).

```
1 from Ultrasonic import *     #import Led
2 ultrasonic=Ultrasonic()      #create an object
3 data=ultrasonic.get_distance() #Get the value
4 print ("Obstacle distance is "+str(data)+"CM")
```

These code can be integrated to one code to achieve your requirement.

What's next?

Thanks for your reading.

This book is all over here. If you find any mistakes, missions or you have other ideas and questions about contents of this book or the kit and ect., please feel free to contact us, and we will check and correct it as soon as possible.

After completing the contents in this book, you can try to reform this smart car, such as purchasing and installing other Freenove electronic modules, or improving the code to achieve different functions. We will also try our best to add more new functions and update the code on our github (<https://github.com/freenove>).

If you want to learn more about Arduino, Raspberry Pi, smart cars, robots and orther interesting products in science and technology, please continue to focus on our website. We will continue to launch cost-effective, innovative and exciting products.

www.freenove.com

Thank you again for choosing Freenove products.
