Welcome

Thank you for choosing Freenove products!

About Battery

First, read the document **About_Battery.pdf** in the unzipped folder. If you did not download the zip file, please download it and unzip it via link below. https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/archive/master.zip

Get Support and Offer Input

Freenove provides free and responsive product and technical support, including but not limited to:

- Product quality issues
- Product use and build issues
- Questions regarding the technology employed in our products for learning and education
- Your input and opinions are always welcome
- We also encourage your ideas and suggestions for new products and product improvements

For any of the above, you may send us an email to:

support@freenove.com

Safety and Precautions

Please follow the following safety precautions when using or storing this product:

- Keep this product out of the reach of children under 6 years old.
- This product should be used only when there is adult supervision present as young children lack necessary judgment regarding safety and the consequences of product misuse.
- This product contains small parts and parts, which are sharp. This product contains electrically conductive parts. Use caution with electrically conductive parts near or around power supplies, batteries and powered (live) circuits.
- When the product is turned ON, activated or tested, some parts will move or rotate. To avoid injuries to hands and fingers, keep them away from any moving parts!
- It is possible that an improperly connected or shorted circuit may cause overheating. Should this happen, immediately disconnect the power supply or remove the batteries and do not touch anything until it cools down! When everything is safe and cool, review the product tutorial to identify the cause.
- Only operate the product in accordance with the instructions and guidelines of this tutorial, otherwise parts may be damaged or you could be injured.
- Store the product in a cool dry place and avoid exposing the product to direct sunlight.
- After use, always turn the power OFF and remove or unplug the batteries before storing.

About Freenove

Freenove provides open source electronic products and services worldwide.

Freenove is committed to assist customers in their education of robotics, programming and electronic circuits so that they may transform their creative ideas into prototypes and new and innovative products. To this end, our services include but are not limited to:

- Educational and Entertaining Project Kits for Robots, Smart Cars and Drones
- Educational Kits to Learn Robotic Software Systems for Arduino, Raspberry Pi and micro: bit
- Electronic Component Assortments, Electronic Modules and Specialized Tools
- Product Development and Customization Services

You can find more about Freenove and get our latest news and updates through our website:

http://www.freenove.com

Tools

Preface

Welcome to use Freenove 4WD Smart Car Kit for Raspberry Pi. Following this tutorial, you can make a very cool smart car with many functions.

This kit is based on Pi Raspberry, a popular control panel, so you can share and exchange your experience and design ideas with many enthusiasts all over the world. The parts in this kit include all electronic components, modules, and mechanical components required for making the smart car. And all of them are packaged individually. There are detailed assembly and commissioning instructions in this book.

And if you encounter any problems, please feel free to contact us for fast and free technical support.

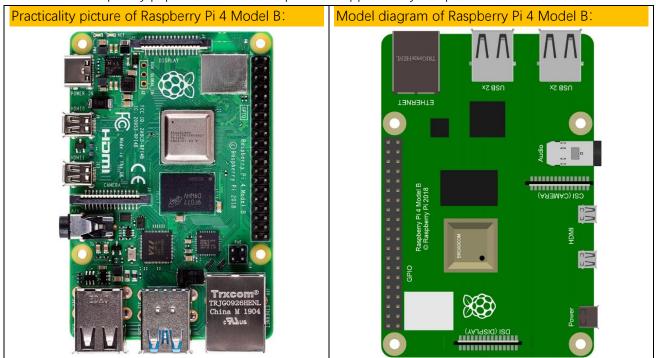

support@freenove.com

The contents in this book can help enthusiasts with little technical knowledge to make a smart car. If you are very interested in Raspberry Pi, and want to learn how to program and build the circuit, please visit our website <u>www.freenove.com</u> or contact us to buy the kits designed for beginners: Freenove Basic\LCD1602\Super\Ultrasonic\RFID\Ultimate Starter Kit for Raspberry Pi

Raspberry Pi Introduction

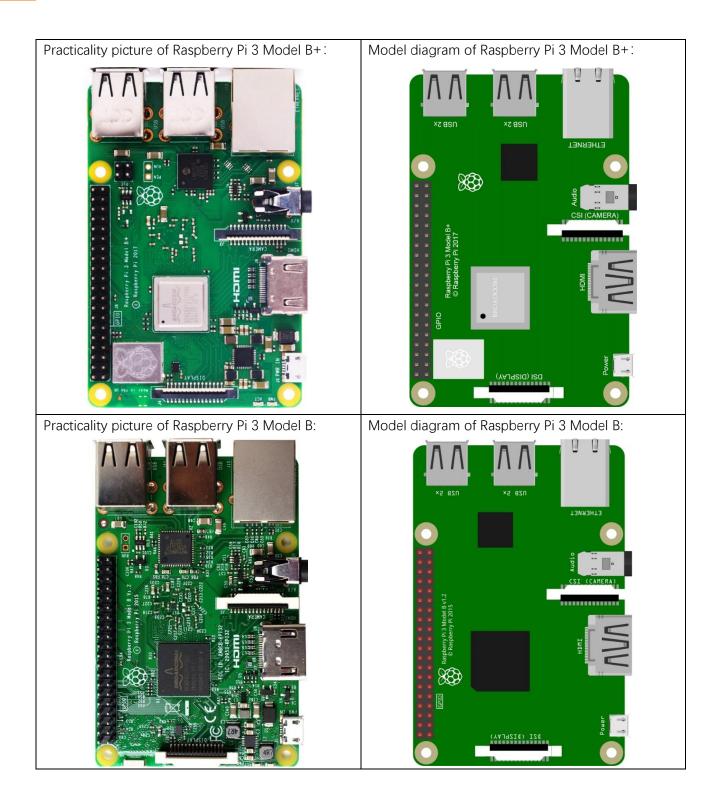

Raspberry Pi (called RPi, RPI, RasPi, the text these words will be used alternately later), a micro-computer with size of a card, quickly swept the world since its debut. It is widely used in desktop workstation, media center, smart home, robots, and even the servers, etc. It can do almost anything, which continues to attract fans to explore it. Raspberry Pi used to be running with Linux system and along with the release of windows 10 IoT. We can also run it with Windows. Raspberry Pi (with interfaces USB, network, HDMI, camera, audio, display and GPIO), as a microcomputer, can be running in command line mode and desktop system mode. Additionally, it is easy to operate just like Arduino, and you can even directly operate the GPIO of CPU.

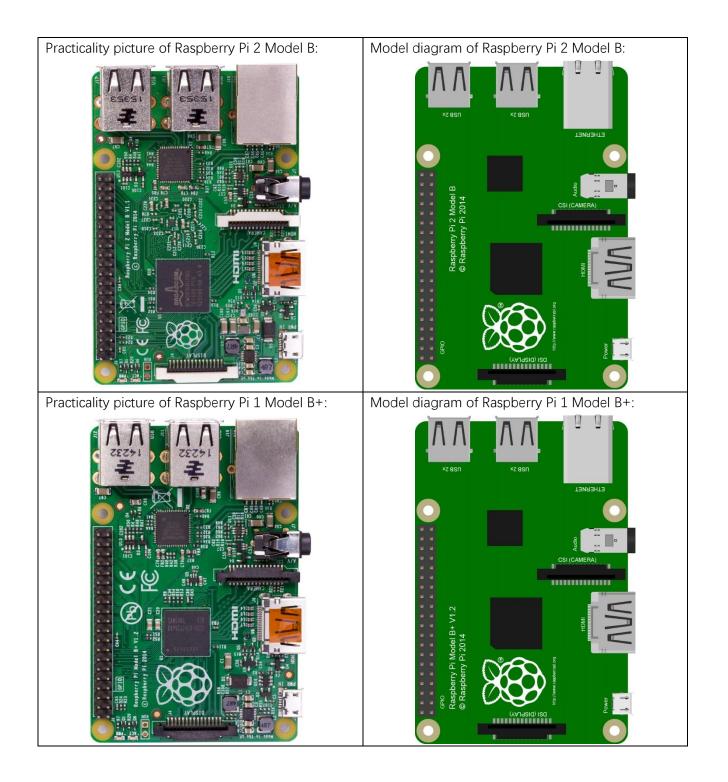

So far, Raspberry Pi has developed to the fourth generation. Changes in versions are accompanied by increase and upgrades in hardware. A type and B type, the first generation of products, have been stopped due to various reasons. Other versions are popular and active and the most important is that they are consistent in the order and number of pins, which makes the compatibility of peripheral devices greatly enhanced between different versions.

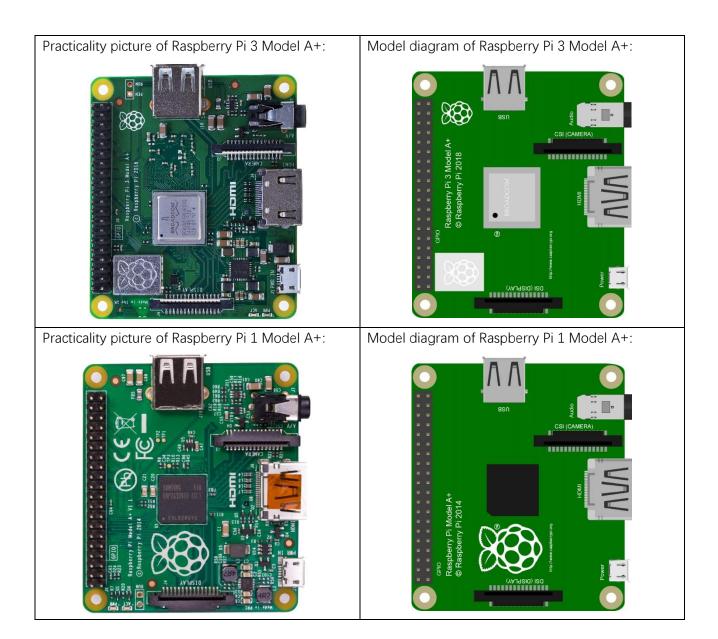

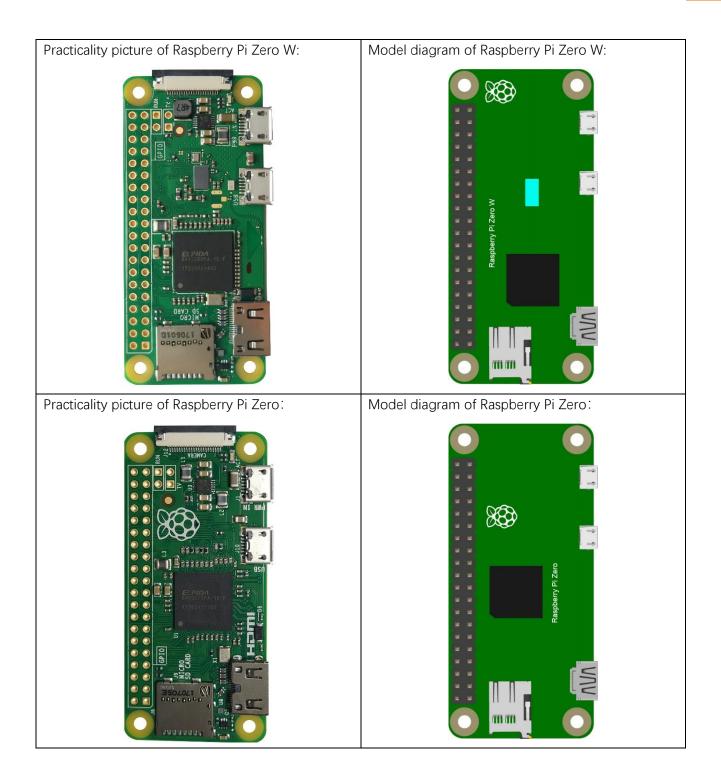

Below are the raspberry pi pictures and model pictures supported by this product.

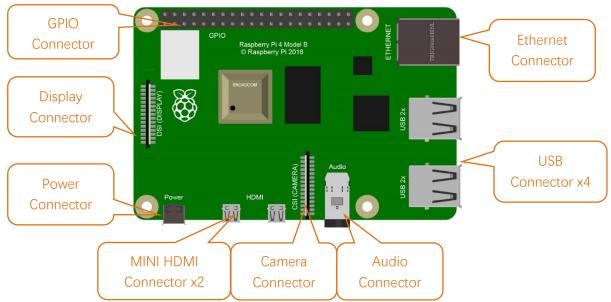

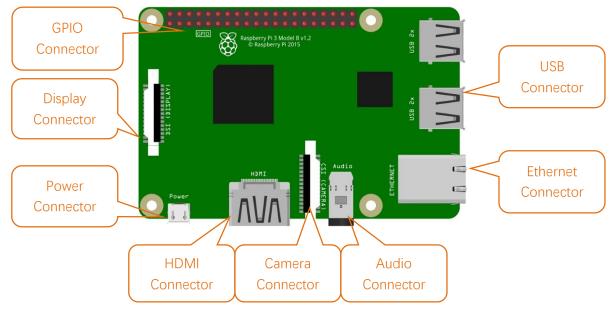

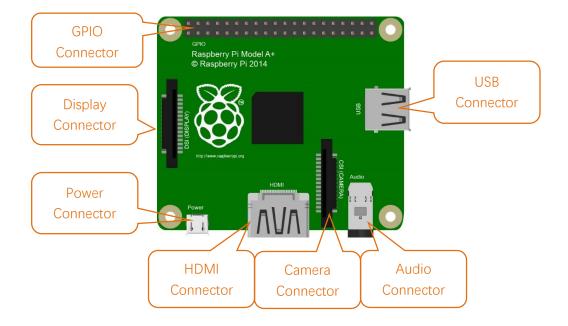

Hardware interface diagram of RPi 4B is shown below:

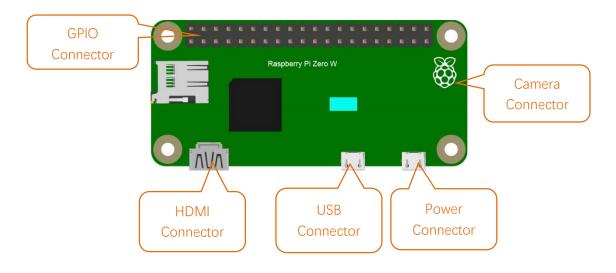

Hardware interface diagram of RPi 3B+/3B/2B/1B+ are shown below:

Hardware interface diagram of RPi 3A+/A+ is shown below:

Hardware interface diagram of RPi Zero/Zero W is shown below:

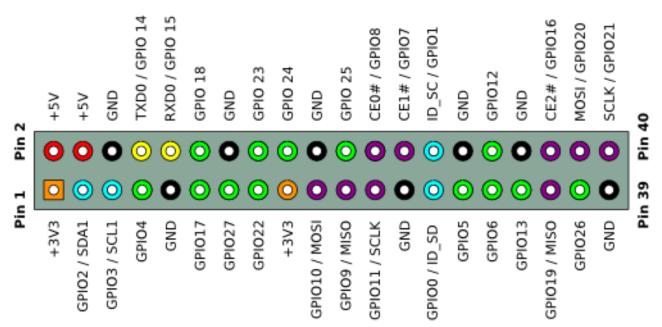

GPIO

GPIO: General purpose input/output. We will introduce the specific feature of the pins on the Raspberry Pi and what you can do with them. You can use them for all sorts of purposes. Most of them can be used as either inputs or outputs, depending on your program.

When programming the GPIO pins there are 3 different ways to refer to them: GPIO numbering, physical numbering, WiringPi GPIO Numbering.

BCM GPIO Numbering

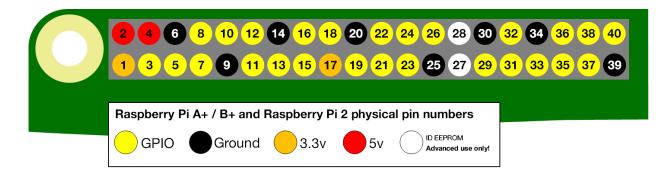

Raspberry Pi CPU use BCM2835/BCM2836/BCM2837of Broadcom. GPIO pin number is set by chip manufacturer. These are the GPIO pins as that computer recognizes. The numbers are unordered and don't make any sense to humans. You will need a printed reference or a reference board that fits over the pins. Each pin is defined as below:

For more details about pin definition of GPIO, please refer to http://pinout.xyz/

PHYSICAL Numbering

Another way to refer to the pins is by simply counting across and down from pin 1 at the top left (nearest to the SD card). This is 'physical numbering', as shown below:

WiringPi GPIO Numbering

Different from the previous mentioned two kinds of GPIO serial numbers, RPi GPIO serial number of the WiringPi was renumbered. Here we have three kinds of GPIO number mode: based on the number of BCM chip, based on the physical sequence number and based on wiringPi. The correspondence between these three GPIO numbers is shown below:

wiringPi Pin	BCM GPIO	Name	Header	Name	BCM GPIO	wiringPi Pin		
	_	3.3v	1 2	5v	_	_		Ч
8	R1:0/R2:2	SDA	3 4	5v				For
9	R1:1/R2:3	SCL	5 6	0v				ى
7	4	GPIO7	7 8		14	15	H	A
		0v	9 10		15	16	For	A+,
0	17	GPIO0	11 12	GPIO1	18	1	Ч	В
2	R1:21/R2:27	GPIO2	13 14	0v	—	—	Ρ	`+
3	22	GPIO3	15 16	GPIO4	23	4	щ.	
		3.3v	17 18	GPIO5	24	5	В	2B,
12	10	MOSI	19 20	0v			\sim	
13	9	MISO	21 22	GPIO6	25	6		3B,
14	11	SCLK	23 24	CE0	8	10		
		0v	25 26	CE1	7	11		3B
30	0	SDA.0	27 28	SCL.0	1	31		,+
21	5	GPIO.21	29 30	0V				
22	6	GPIO.22	31 32	GPIO.26	12	26		4B,
23	13	GPIO.23	33 34	0V				
24	19	GPIO.24	35 36	GPIO.27	16	27		Ze
25	26	GPIO.25	37 38	GPIO.28	20	28		Zero
		0V	39 40	GPIO.29	21	29		0
wiringPi	BCM	Name	Header	Name	BCM	wiringPi		
Pin	GPIO				GPIO	Pin		

(For more details, please refer to https://projects.drogon.net/raspberry-pi/wiringpi/pins/)

You can also use the following command to view their correspondence. gpio readall

For more details about wiringPi, please refer to http://wiringpi.com/ .

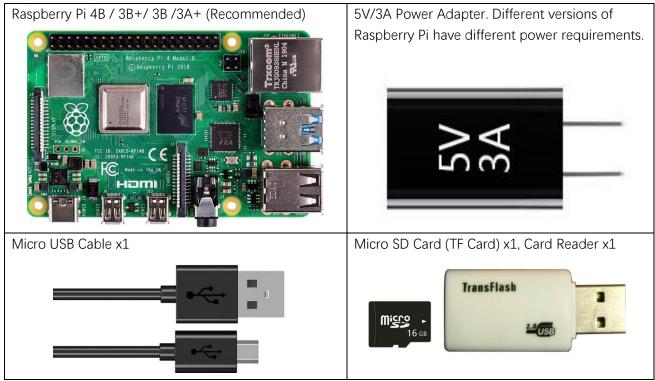

Chapter 0 Raspberry Pi Preparation

Install a System

Firstly, install a system for your RPi.

Component List

Required Components

This robot also supports the following versions of the Raspberry Pi, but **additional accessories** need to be prepared by yourself.

Raspberry	Additional accessories
Raspberry Pi Zero W	Camera cable(>25cm) for zero w, 15 Pin 1.0mm Pitch to 22 Pin 0.5mm
	https://www.amazon.com/dp/B076Q595HJ/
Raspberry Pi Zero 1.3	wireless network adapter,
	Camera cable(>25cm) for zero w, 15 Pin 1.0mm Pitch to 22 Pin 0.5mm,
	OTG cable (USB Type micro B to USB Type A)
Raspberry Pi 2 Model B	wireless network adapter
Raspberry Pi 1 Model A+	wireless network adapter
Raspberry Pi 1 Model B+	wireless network adapter

Product	Recommended PSU current capacity	Maximum total USB peripheral current draw	Typical bare-board active current consumption
Raspberry Pi Model A	700mA	500mA	200mA
Raspberry Pi Model B	1.2A	500mA	500mA
Raspberry Pi Model A+	700mA	500mA	180mA
Raspberry Pi Model B+	1.8A	600mA/1.2A (switchable)	330mA
Raspberry Pi 2 Model B	1.8A	600mA/1.2A (switchable)	350mA
Raspberry Pi 3 Model B	2.5A	1.2A	400mA
Raspberry Pi 3 Model A+	2.5A	Limited by PSU, board, and connector ratings only.	350mA
Raspberry Pi 3 Model B+	2.5A	1.2A	500mA
Raspberry Pi 4 Model B	3.0A	1.2A	600mA
Raspberry Pi Zero W	1.2A	Limited by PSU, board, and connector ratings only.	150mA
Raspberry Pi Zero	1.2A	Limited by PSU, board, and connector ratings only	100mA

Power requirement of different versions of Raspberry Pi is shown in following table:

For more details, please refer to https://www.raspberrypi.org/help/faqs/#powerReqs

In addition, RPi also needs a network cable used to connect it to wide area network.

All of these components are necessary. Among them, the power supply is required at least 5V/2.5A, because lack of power supply will lead to many abnormal problems, even damage to your RPi. So power supply with 5V/2.5A is highly recommend. SD Card Micro (recommended capacity 16GB or more) is a hard drive for RPi, which is used to store the system and personal files. In later projects, the components list with a RPi will contains these required components, using only RPi as a representative rather than presenting details.

Optional Components

Under normal circumstances, there are two ways to login to Raspberry Pi: using independent monitor, or remote desktop to share a monitor with your PC.

Required Accessories for Monitor

If you want to use independent monitor, mouse and keyboard, you also need the following accessories.

- 1.Display with HDMI interface
- 2. Mouse and Keyboard with USB interface

As to Pi Zero and Pi Zero W, you also need the following accessories.

- 1. Micro-HDMI to HDMI converter wire.
- 2. Micro-USB to USB-A Receptacles converter wire (Micro USB OTG wire).
- 3. USB HUB.
- 4. USB transferring to Ethernet interface or USB Wi-Fi receiver.

For different Raspberry Pi, the optional items are slightly different. But all of their aims are to convert the special interface to standard interface of standard Raspberry Pi.

Item	Pi Zero	Pi Zero W	Pi A+	Pi 3A+	Pi B+/2B	Pi 3B/3B+/4B
Monitor	Yes	Yes	Yes	Yes	Yes	Yes
Mouse	Yes	Yes	Yes	Yes	Yes	Yes
Keyboard	Yes	Yes	Yes	Yes	Yes	Yes
Micro-HDMI to HDMI cable	Yes	Yes	No	No	No	No
Micro-USB to USB-A OTG cable	Yes	Yes	No	No	No	No
USB HUB	Yes	Yes	Yes	Yes	No	No
USB transferring to Ethernet interface	select one from	optional	select one from	optional	Internal Integration	
USB Wi-Fi receiver	two or select two from two	Internal Integration	two or select two from two	Internal Integration	optional	Internal Integration

Required Accessories for Remote Desktop

If you don't have an independent monitor, or you want to use a remote desktop, first you need to login to Raspberry Pi through SSH, then open the VNC or RDP service. So you need the following accessories.

Item	Pi Zero	Pi Zero W	Pi A+	Pi 3A+	Pi B+/2B	Pi 3B/3B+/4B
Micro-USB to USB-A	Yes	Yes	No			
OTG cable						
USB transferring to	Yes	Yes	Yes			
Ethernet interface					NO	

Raspberry Pi OS

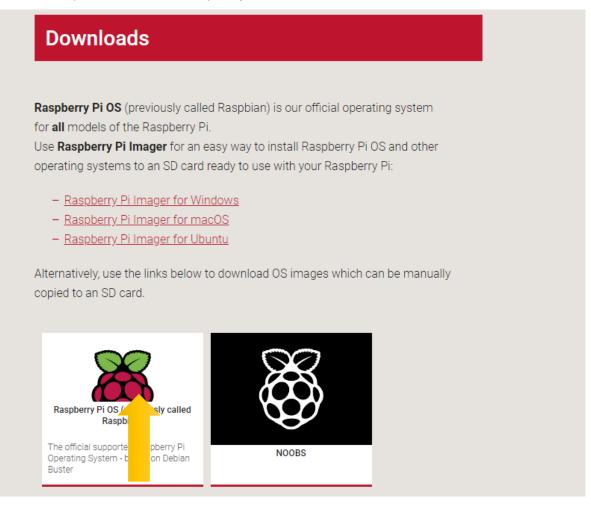

Official Method

It is recommended to use this method. You can follow the official method to install the system for raspberry pi <u>https://projects.raspberrypi.org/en/projects/raspberry-pi-setting-up/2</u> In this way, the system will be download **automatically** via the application.

Download system manually (optional)

After installing the Imager Tool in link above. You can also download the system manually first.

Visit RPi official website (<u>https://www.RaspberryPi.org/</u>), click "Downloads" and choose to download "Raspberry Pi OS". Raspberry Pi OS supported by RPI is an operating system based on Linux, which contains a number of contents required for RPi. We recommended Raspberry Pi OS to beginners. All projects in this tutorial are operated under the Raspberry Pi OS.

https://www.raspberrypi.org/downloads

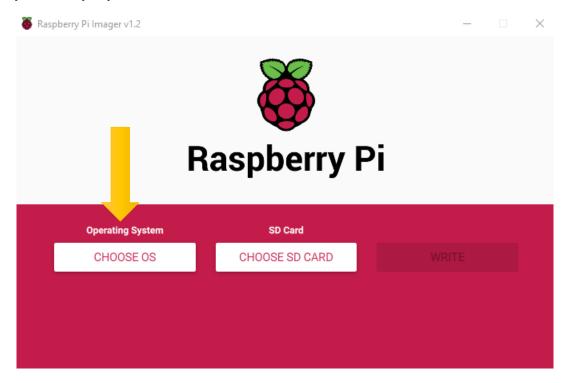

Need support? 🖂 support.freenove.com

After the zip file is download.

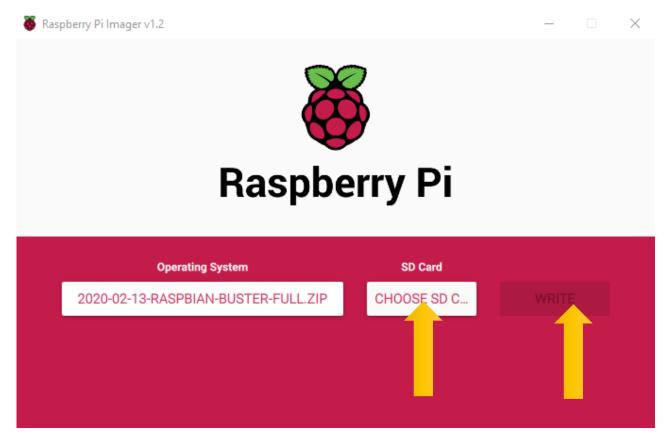

Write System to Micro SD Card

First, put your Micro **SD card** into card reader and connect it to USB port of PC. Then open imager toll, choose Choose system that you just download in Use custom.

	Operating System	x
•	other Raspbian based images	
	LibreELEC	>
	A Kodi Entertainment Center distribution	
	Ubuntu	、
9	Choose from Ubuntu Core and Server images	,
a	Misc utility images	、
7	EEPROM recovery, etc.	
-	Erase	
	Format card as FAT32	
	Use custom	
	Select a custom .img from your computer	

Choose the SD card. Then click "WRITE".

Need support? 🖂 support.freenove.com

Start Raspberry Pi

If you don't have a spare monitor, please jumper to next section. If you have a spare monitor, please follow steps in this section.

After the system is written successfully, take out Micro SD Card and put it into the card slot of RPi. Then connect RPi to screen through the HDMI, to mouse and keyboard through the USB port, to network cable through the network card interface and to the power supply. Then your RPi starts initially. Later, you need to enter the user name and password to login. The default user name: pi; password: raspberry. Enter and login. After login, you can enter the following interface.

Now, you have successfully installed the Raspberry Pi OS for your RPi. Then you can connect WiFi on the right corner.

Now you can jumper to <u>VNC Viewer</u>.

Remote desktop & VNC

After you log in Raspberry Pi, please use VNC Viewer to connect Raspberry Pi for this robot. Other remote ways may not support GUI.

If you have logged in Raspberry Pi please skip to <u>VNC Viewer</u>.

If you don't have a spare display, mouse and keyboard for your RPi, you can use a remote desktop to share a display, keyboard, and mouse with your PC. Below is how to use remote desktop under the Windows and mac OS.

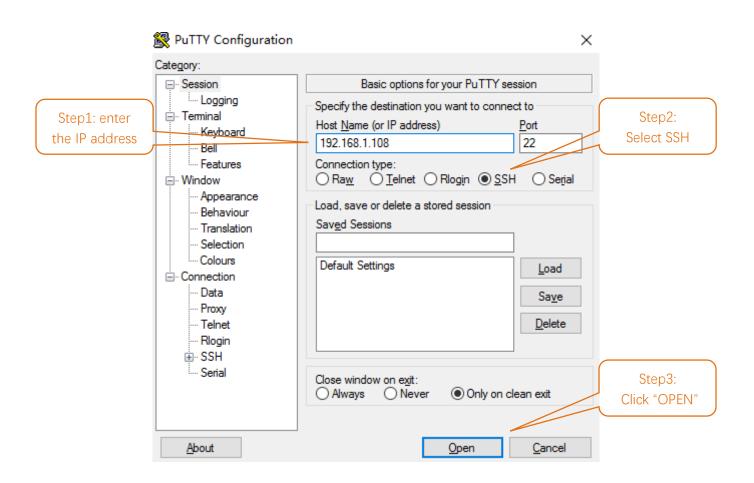

Enable SSH

Under the latest version of Raspberry Pi OS, SSH is closed by default. So you need to open it first. After write system, create a folder named "ssh" under generated boot disk of Micro SD Card, then the SSH connection will be opened.

Windows OS Remote Desktop

The windows built-in application remote desktop corresponds to the Raspberry Pi xrdp service. Download the tool software Putty. Its official address: <u>http://www.putty.org/</u> Or download it here: <u>http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html</u>

Then use net cable to connect your RPi to the routers and ensure your PC and your RPi are in the same LAN. Then put the system Micro SD Card prepared before into the slot of the RPi and turn on the power supply waiting for starting RPi. Later, enter router client to inquiry IP address named "raspberry pi". For example, I have inquired to my RPi IP address, and it is "192.168.1.108". Then open Putty, enter the address, select SSH, and then click "OPEN", as shown below:

There will appear a security warning at first login. Just click "YES".

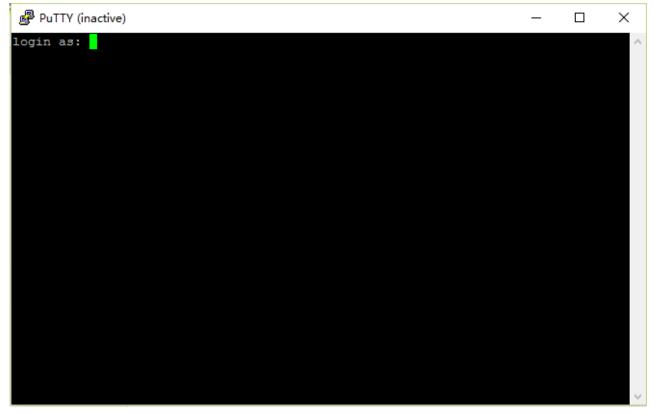

Æ

PuTTY Security Alert

WARNING - POTENTIAL SECURITY BREACH!

The server's host key does not match the one PuTTY has cached in the registry. This means that either the server administrator has changed the host key, or you have actually connected to another computer pretending to be the server. The new rsa2 key fingerprint is: ssh-rsa 2048 7a:e1:50:ba:dc:01:87:1b:a5:f9:d2:d4:12:d6:fe:ab If you were expecting this change and trust the new key, hit Yes to update PuTTY's cache and continue connecting. If you want to carry on connecting but without updating the cache, hit No. If you want to abandon the connection completely, hit Cancel. Hitting Cancel is the ONLY guaranteed safe choice. \times

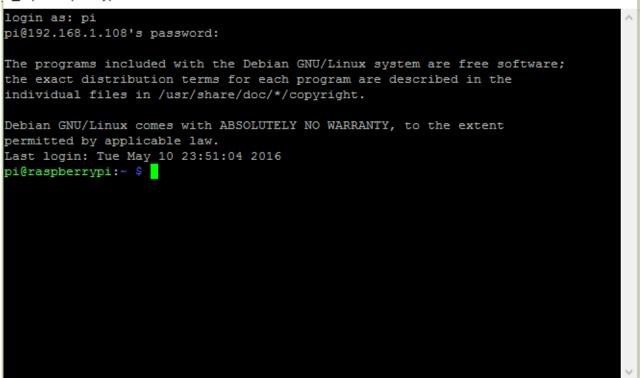

Then there will be a login interface (RPi default user name: **pi**; the password: **raspberry**). When you enter the password, there will be **no display** on the screen. This is normal. After the correct input, press "Enter" to confirm.

Then enter the command line of RPi, which means that you have successfully login to RPi command line mode.

×

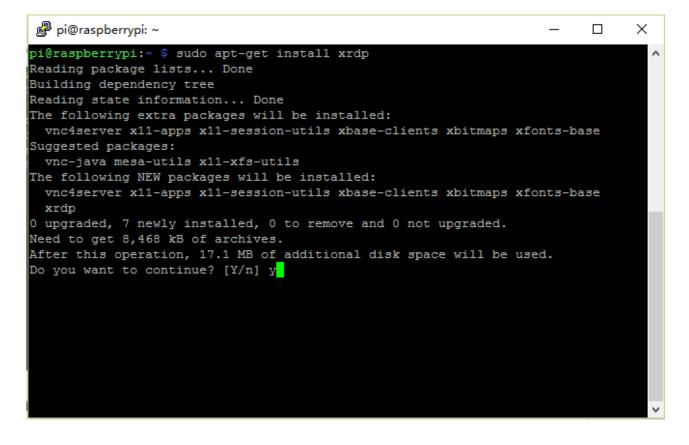

🧬 pi@raspberrypi: ~

If you want to use built-in Remote Desktop Connection under Windows, you need install xrdp service on Raspberry Pi.

Next, install a xrdp service, an open source remote desktop protocol(xrdp) server, for RPi. Type the following command, then press enter to confirm: sudo apt-get install xrdp

Later, the installation starts.

Enter "Y", press key "Enter" to confirm.

After the installation is completed, you can use Windows remote desktop applications to login to your RPi.

Login to Windows remote desktop

Use "WIN+R" or search function, open the remote desktop application "mstsc.exe" under Windows, enter the IP address of RPi and then click "Connect".

5	Remote Desktop Connection – 🗆 🗙
	Remote Desktop Connection
<u>C</u> omputer: User name: You will be a	192.168.1.108 ✓ None specified sked for credentials when you connect.
Show (Optio Connect Help

Later, there will be xrdp login screen. Enter the user name and password of RPi (RPi default user name: pi; password: raspberry) and click "OK".

Login to ×rdp	Module	sesman-Xvnc 💌
	username password	
	ОК	Cancel Help

Later, you can enter the RPi desktop system.

Here, you have successfully used the remote desktop login to RPi.

Raspberry Pi 4B/3B+/3B integrates a Wi-Fi adaptor. You can use it to connect to your Wi-Fi. Then you can use the wireless remote desktop to control your RPi. This will be helpful for the following work. Raspberry Pi of other models can use wireless remote desktop through accessing an external USB wireless card.

MAC OS Remote Desktop

Connect your pi to the the router via a network cable.

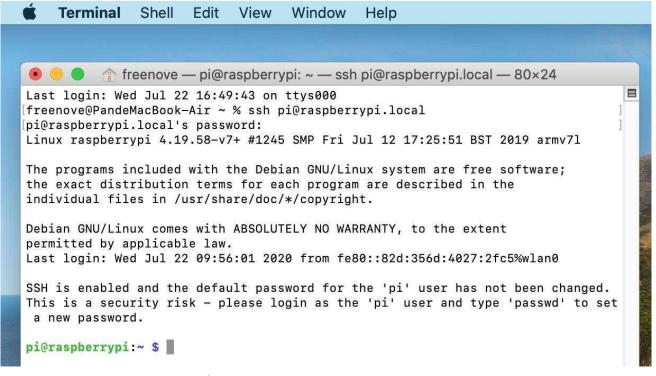

Open the terminal and type following command.

ssh pi@raspberrypi.local

The password is **raspberry** by default, case sensitive.

Ś	Terminal	Shell	Edit	View	Window	Help	
Las	enove@Pande	d Jul 2	2 16:44	4: <u>55 on</u>	++vs000	errypi.local — 80×24 rypi.local	
pi@	Praspberrypi	.local'	s passı	word. 👔			

You may need to type yes during the process.

When you see pi@raspberrypi:~ \$, you have logged in Pi successfully. Then you can skip to next section.

You can also use the IP to log in Pi.

Enter router client to inquiry IP address named "raspberry pi". For example, I have inquired to my RPi IP address, and it is "192.168.1.131".

Open the terminal and type following command. ssh pi@192.168.1.131

OK Cancel

Enter ip address of your Raspberry Pi and fill in a Name. And click OK.

Then on the VNC Viewer panel, double-click new connection you just created, and the following dialog box pops up.

V2 Authentica	V2 Authentication						
VNC Server:	VNC Server: 192.168.1.117::5900						
Username:	pi						
Password:	assword:						
Remembe	Remember password						
Catchphrase	Catchphrase: Sister logo octopus. Giraffe Gloria time.						
Signature:	8b-6b-40-50-f6-9d-8b-f8						
	OK Cancel						

Enter username: pi and Password: raspberry. And click OK.

Here, you have logged in to Raspberry Pi successfully by using VNC Viewer

If the resolution ratio is not great or there is just a little window, you can set a proper resolution ratio via steps below.

sudo raspi-config

Select 7 Advanced Options \rightarrow A5 Resolution \rightarrow proper resolution ratio (set by yourself) \rightarrow OK \rightarrow Finish. And then reboot Raspberry Pi.

Choose screen resolution	
Default	720x480
DMT Mode 4	640x480 60Hz 4:3
DMT Mode 9	800x600 60Hz 4:3
DMT Mode 16	1024x768 60Hz 4:3
DMT Mode 85	1280x720 60Hz 16:9
DMT Mode 35	1280x1024 60Hz 5:4
DMT Mode 51	1600x1200 60Hz 4:3
DMT Mode 82	1920x1080 60Hz 16:9
<0k>	<cancel></cancel>

In addition, your VNC Viewer window may zoom your Raspberry Pi desktop. You can change it. On your VNC View control panel, click right key. And select Properties->Options label->Scaling. Then set proper scaling.

			🚾 raspberry pi - Properties	-		×
			General Options Expert			
			General Picture quality: Automatic ☐ View-only Scaling 100% ☑ Preserve aspect ratio Keys ☑ Pass media keys directly to VNC Server ☑ Pass special keys directly to VNC Server		~	
raspbe	Connect					
	Rename	F2				
	Delete					
	Duplicate	Ctrl+D				
	Properties	Alt+Enter		ОК	Cano	el

Here, you have logged in to Raspberry Pi successfully by using VNC Viewer and operated proper setting.

Raspberry Pi 4B/3B+/3B integrates a Wi-Fi adaptor.If you did not connect Pi to WiFi. You can connect it to wirelessly control the robot.

Need support? 🖂 support.freenove.com

Chapter 1 Software installation and Test (necessary)

If you have any concerns, please feel free to contact us via support@freenove.com

In this chapter, we will make some necessary preparation: start your Pi Raspberry and install some necessary libraries. Then test some parts.

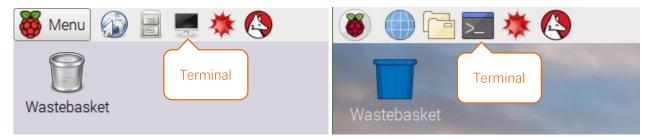

Note:

The installation of libraries takes much time. You can power Raspberry Pi with a power supply Cable. Batteries are needed when driving peripherals such as motors, servos, LEDs, etc.

If you are using **remote desktop mode** to login Raspberry Pi, you need to use <u>VNC viewer</u>.

Step 1 Obtain the Code

To download the code, you can power Raspberry Pi with a power supply cable **or** switch on S1 (Power Switch). Then open the Raspberry Pi and the terminal. You can open the terminal by clicking as shown below, or you can press "CTRL + ALT + T" on the desktop.

The terminal is shown below:

	pi@raspberrypi: ~	_ = ×
<u>File Edit Tabs H</u> elp		
pi@raspberrypi:~ \$		1.0

Open the terminal and type the following commands to obtain the car code. And the code will be placed in the directory "Pi". (Note: Here are two commands. Please execute them in order.)

cd ~

git clone https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi.git

Downloading takes some time. Please wait with patience.

You can also find and download the code by visiting our official website (<u>http://www.freenove.com</u>) or our GitHub repository (<u>https://github.com/freenove</u>).

Please note that this tutorial is based on python3. If you want to use python2, please download another version of the tutorial.

Set Python3 as default python (Necessary)

First, execute python to check the default python on your raspberry Pi. Press Ctrl-Z to exit.

pi@raspberrypi:~ \$ python

If it is python3, you can skip this section.

If it is python2, you need execute the following commands to set default python to python3.

1. Enter directory /usr/bin

cd /usr/bin

2. Delete the originalpython link.

sudo rm python

3. Create new python links to python.

sudo In -s python3 python

4. Check python. Press Ctrl-Z to exit.

python

```
pi@raspberrypi:/usr/bin $ sudo rm python
pi@raspberrypi:/usr/bin $ sudo ln -s python3 python
pi@raspberrypi:/usr/bin $ python
Python 3.5.3 (default, Jan 19 2017, 14:11:04)
[GCC 6.3.0 20170124] on linux
Type "help", "copyright", "credits" or "license" for more information.
```

If you want to set python2 as default python in **other projects**, just repeat the commands above and change python3 to python2.

Shortcut Key

Now, we will introduce several shortcuts that are very **useful** and **commonly used** in terminal.

1. **up and down arrow keys**. History commands can be quickly brought back by using up and down arrow keys, which are very useful when you need to reuse certain commands.

When you need to type commands, pressing "↑" will go backwards through the history of typed commands, and pressing "↓" will go forwards through the history of typed command.

2. **Tab key**. The Tab key can automatically complete the command/path you want to type. When there are multiple commands/paths conforming to the already typed letter, pressing Tab key once won't have any result. And pressing Tab key again will list all the eligible options. This command/path will be completely typed as soon as you press the Tab key when there is only one eligible option.

As shown below, under the '~'directory, enter the Documents directory with the "cd" command. After typing "cd D", press Tab key, then there is no response. Press Tab key again, then all the files/folders that begin with "D" is listed. Continue to type the character "oc", then press the Tab key, and then "Documents" is completely typed automatically.

pi@raspberrypi:~ \$ cd D
Desktop/ Documents/ Downloads/
pi@raspberrypi:~ \$ cd Documents/

Step 2 Configure I2C

Enable I2C

The I2C interface raspberry pi is closed by default. You need to open it manually. You can enable the I2C interface in the following way. Open the terminal. Type command in the terminal:

sudo raspi-config

Then open the following dialog box:

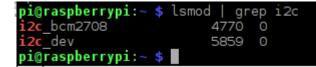

Raspberry Pi Software	Configuration Tool (raspi-config)
1 Change User Password 2 Network Options 3 Boot Options 4 Localisation Options 5 Interfacing Options 6 Overclock 7 Advanced Options	Change password for the current u Configure network settings Configure options for start-up Set up language and regional sett Configure connections to peripher Configure overclocking for your P Configure advanced settings
9 About raspi-config	Update this tool to the latest ve Information about this configurat
<select></select>	<finish></finish>

Choose "5 Interfacing Options"→"P5 I2C"→"Yes"→"Finish" in order and restart your RPi later. Then the I2C module starts.

Type a command to check whether the I2C module is enabled:

```
Ismod | grep i2c
```

If I2C module has been enabled, the following content will show up (the numbers showing in your device may be different):

Install I2C-Tools

Type the command to install I2C-Tools.

sudo apt-get install i2c-tools

Install python-smbus

Python-smbus is a module of the program Python, which contains some classes and methods to operate I2C. Type the following command to install python-smbus:

sudo apt-get install python3-smbus

Communication test

The smart car board has two chips, PCF8591 and PCA9685. Their I2C addresses are 0X48 and 0X40 respectively. Command "i2cdetect –y 1" can detect whether the board is successfully connected to Raspberry Pi.

i2	2cde	etect	-у	1																	
pi@r	as	bei	ry	pi: ^	- \$	i20	cdet	tect	t -)	/ 1											
	Θ			3							а	b	С	d	е	f					
00:																					
10:																					
20:																					
30:																					
40:	40								48												
50:																					
60:																					
70:																					
pi@r	as	bei	rry	pi:-	- \$																

If an I2C device is connected to your RPI, its I2C address will be displayed here.

Step 3 Run the Libraries Installation Program

All the commands are based on python3. If the default python is python2, please refer to the <u>Step1</u> to set python3 to default python.

- Execute following commands to enter directory of "setup.py". cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code
- 2. Run setup.py sudo python setup.py

This program will automatically install the pca9685, rpi_ws281x, PyQt5 library, etc. Please **reboot** the Raspberry Pi after the installation is completed, as shown below.

Now the installation is successful. Please reboot raspberry pi, 'sudo reboot'

If the installation fails, please rerun setup.py. After the installation is completed, restart the Raspberry Pi. Most installation failures are caused by network reasons.

sudo python setup.py

Chapter 2 Assemble Smart Car

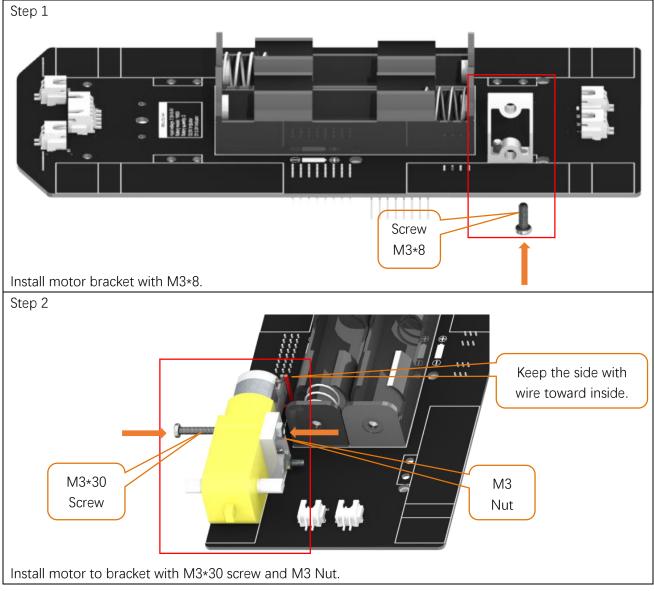

If you have any concerns, please feel free to contact us via support@freenove.com

Motor and wheel

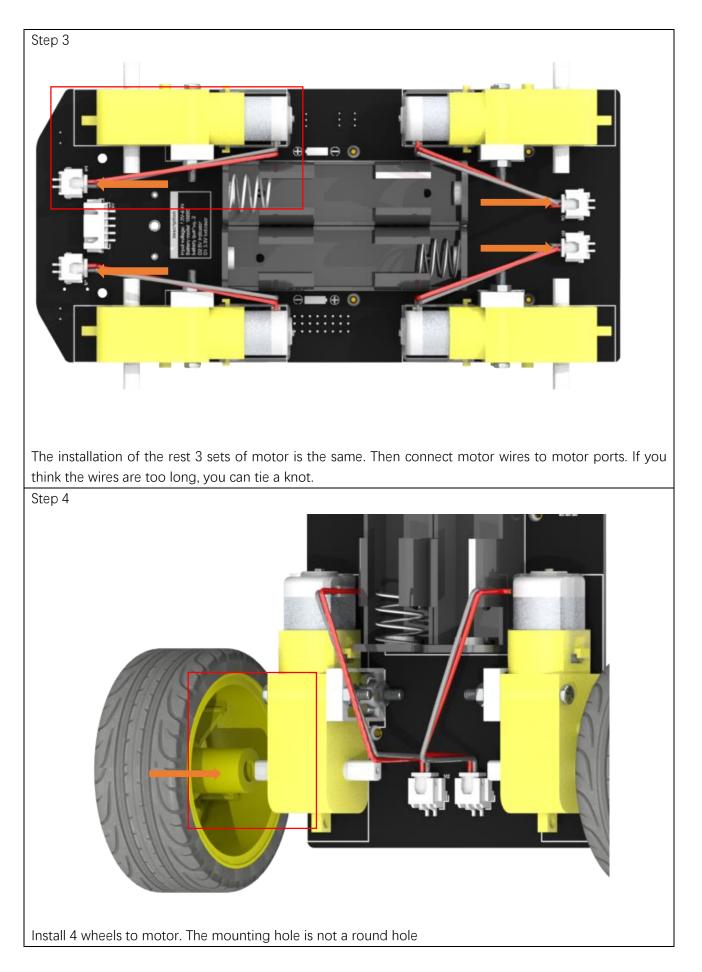

There is a special fixed bracket to fix motor, which contains an aluminum bracket, two M3*30 screws, two M3*8 screws, and two M3 nuts, as shown below:

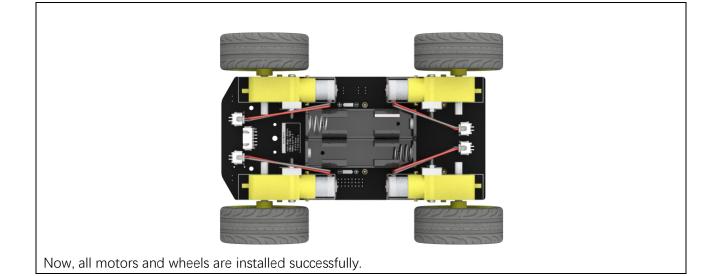

Installation steps:

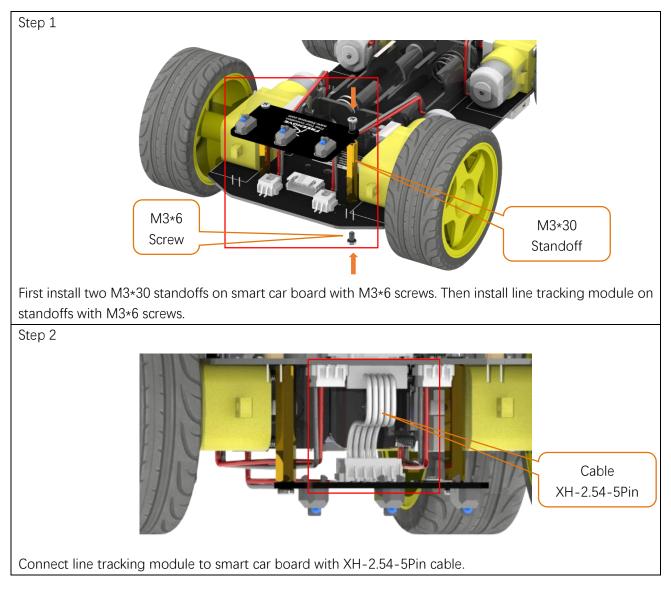

Need support? 🖂 support.freenove.com

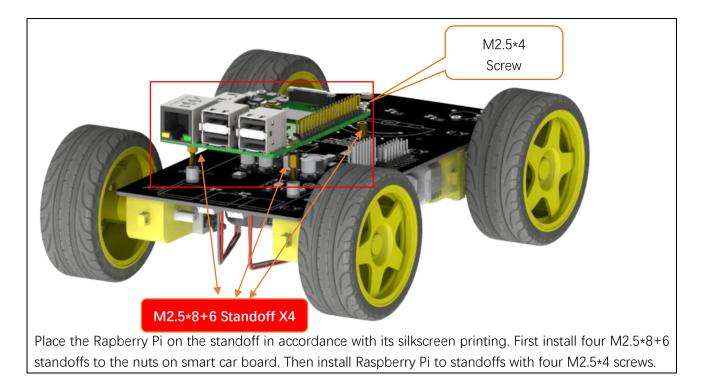

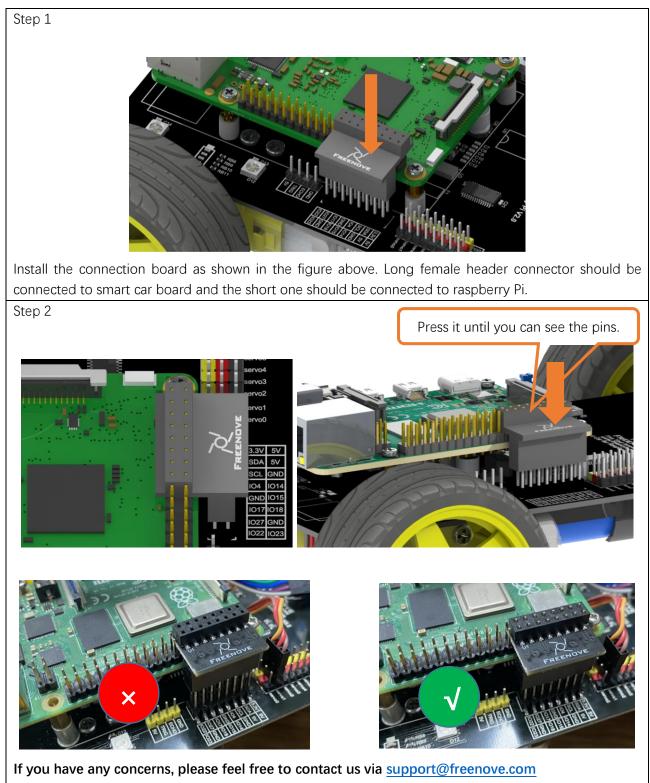

Infrared line tracking module

Raspberry Pi

Connection board

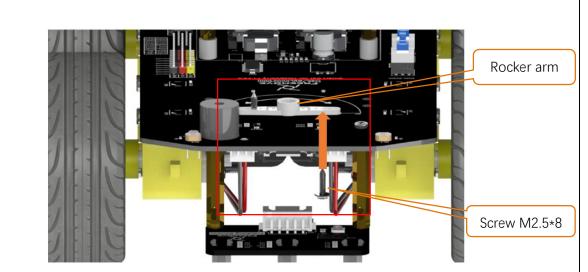

We will offer you satisfied solution.

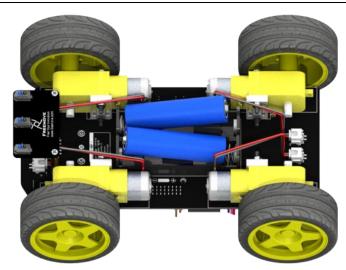

Pan Tilt

There are two servo packages. Each package contains one servo, three rocker arms, one M2*4 screw and two M2.5*8 screws, as shown below:

Place the Rocker arm on the smart car board in accordance with its silkscreen printing. Use two M2.5*8 screws to install it to smart car board.

Finally, install two 18650 batteries. Please refer to About_Battery.pdf in the unzipped folder.

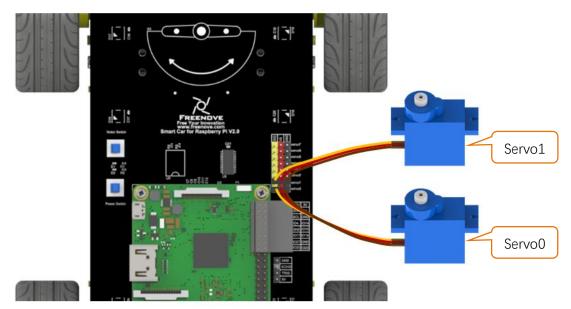

Please push the battery to + ends of battery holder to make the connection good enough.

Run program

In the first chapter, we did not install the Pan-Tilt. Because we need to run programs for the installation of the servos to ensure that the servos rotate to the correct angle.

Next let us install the Pan-Tilt.

Connect two servos to port Servo0 and port Servo1 on the smart car board. And please remember the numbers of the servos.

Enter the following command in the terminal:

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

1.If not, execute the cd command:

cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server

2.Execute Servo.py command:

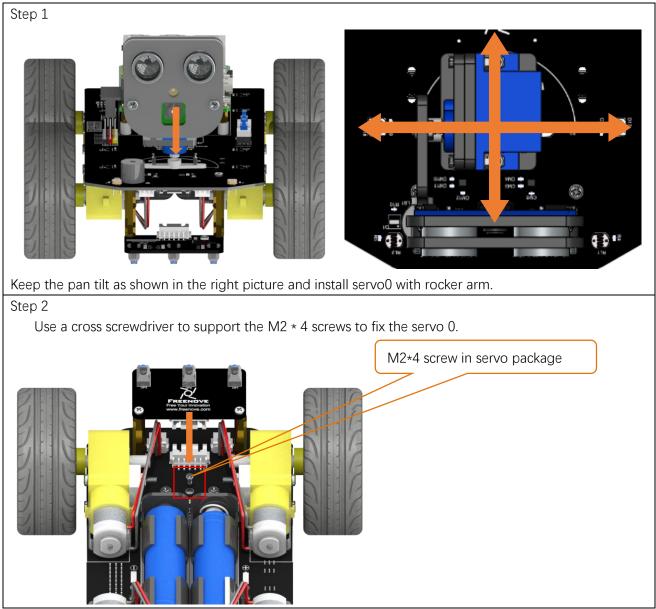

sudo python servo.py

Then servos rotate to a proper angle. Please keep the connection between the servos and the smart car board.

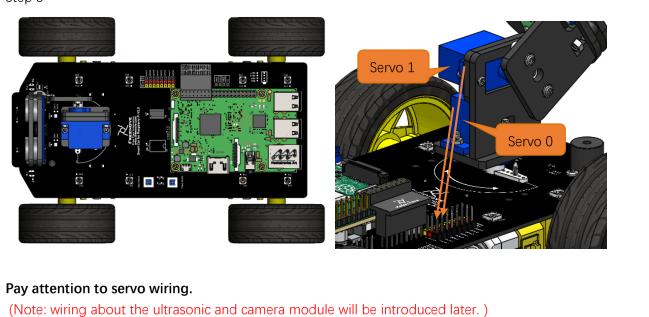

Step 2 Step 3 Step 1 Acrylic Arcylic part Servo0 M3*14 M2*10 Step 5 Step 6 Step 4 Servo1 Arcylic M1.4*4 M2*10 Camera Servo0 Step 7 Step 8: Step 9 M2.5*8 M3*14 M3*14 M3*14 Step 10 Step 11 After finished Keep them vertical M2*4 screw in servo package

Installation steps: (Note: Do not disorder Servo0 and Servo1 during the installation.)

Install Pan Tilt on smart car board.

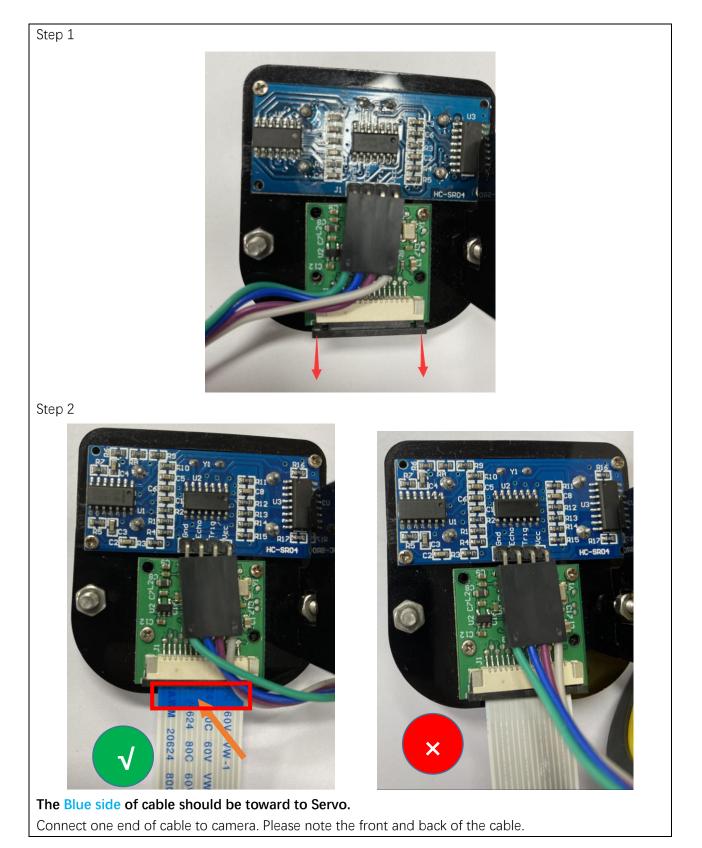

Step 3

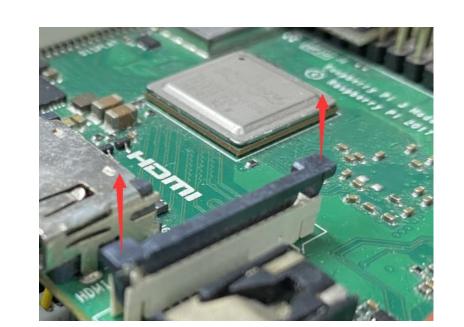

Wiring

Camera

Step 4

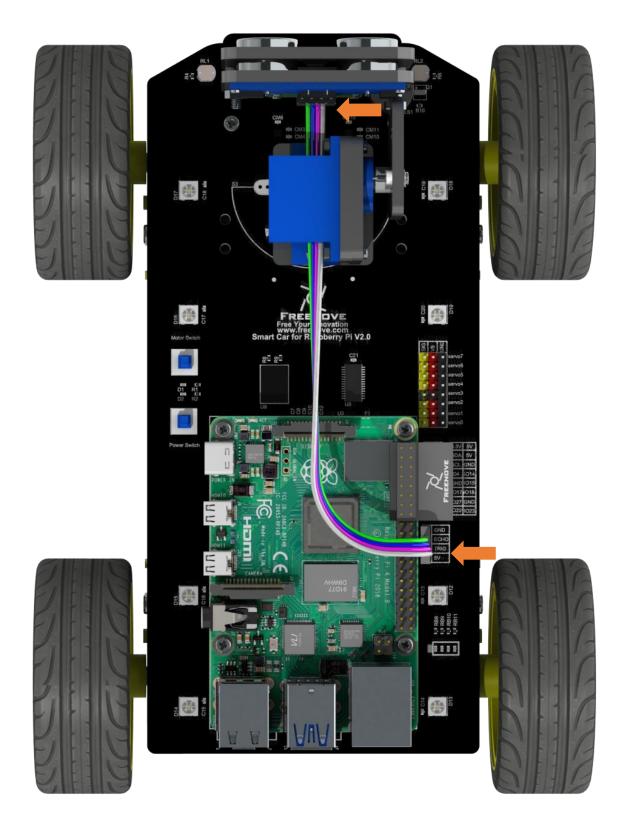

The Blue side of cable should be toward to RPi USB port. Connect another end of cable to raspberry pi. Please note the front and back of the cable.

Ultrasonic

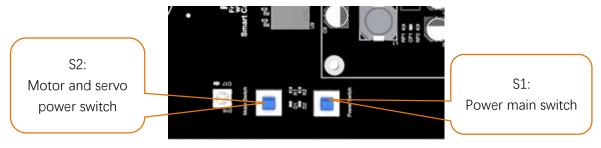

Use jumper wires F/F to connect ultrasonic module with pins on smart car board. **GND-GND, VCC-5V, ECHO-ECHO, TRIG-TRIG**

Chapter 3 Module test (necessary)

If you have any concerns, please feel free to contact us via support@freenove.com

In this section, the car must be equipped with **batteries**, and **Both S1** power switch and **S2** motor switch need to be **preessed**. Then 5V, 3.3V, battery power indicators will be turned on.

During the test, the motor will work. So you can disconnect the wheels or put it on the ground to avoid that it falls down and is damaged. Next, test RGB LED, motor, ultrasonic module, servo, etc.

You can still power Raspberry Pi with a power supply Cable when switches are pressed.

If you have never learned python before, you can learn some basic knowledge via the link below: https://python.swaroopch.com/basics.html

Motor

Run program

Open the terminal of Raspberry Pi. Enter the following commands to test the motor.

- 1. Use the cd command to enter the directory where test.py is located.
 - cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
- 2. Execute test.py command:

sudo python test.py Motor

pi@raspberrypi: ~/Freenove_4WD_SmaCar_Kit_for_Raspberry_Pi/Code/Server 🐱 🔺	×
File Edit Tabs Help	
<pre>pi@raspberrypi:~ \$ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$ sudo python test.py Motor Program is starting The car is moving forward The car is going backwards The car is turning left The car is turning right End of program pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$</pre>	

Result:

The car moves forward for 1 seconds, then moves back for 1 seconds, then turns left for 1 seconds, turns right for 1 seconds, then stops. You can press "Ctrl + C" to end the program ahead of time. If the car doesn't work normally, please check if both switches are pressed.

If the direction is reversed, it moves back then move forward, please follow steps below.

1. Find Motor.py in the following path in your Raspberry Pi:

Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server/Motor.py

Open Motor.py and add a "-" before duty1,2,3,4 like below.

1	<pre>def setMotorModel(self, duty1, duty2, duty3, duty4):</pre>
2	duty1, duty2, duty3, duty4=self.duty_range(duty1, duty2, duty3, duty4)
3	<pre>self.left_Upper_Wheel(-duty1)</pre>
4	<pre>self.left_Lower_Wheel(-duty2)</pre>
5	<pre>self.right_Upper_Wheel(-duty3)</pre>
6	<pre>self.right_Lower_Wheel(-duty4)</pre>

Then save the modification and try again.

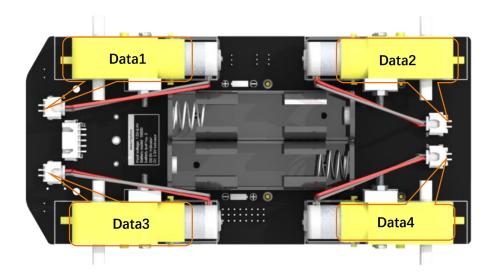

The code is as below:

1	<pre>from Motor import *</pre>	
2	PWM=Motor()	
3	<pre>def test_Motor():</pre>	
4	try:	
5	PWM. setMotorModel (1000, 1000, 1000, 1000)	#Forward
6	<pre>print "The car is moving forward"</pre>	
7	time.sleep(1)	
8	PWM. setMotorModel (-1000, -1000, -1000, -1000)	#Back
9	<pre>print "The car is going backwards"</pre>	
10	time.sleep(1)	
11	PWM. setMotorModel (-1500, -1500, 2000, 2000)	#Left
12	<pre>print "The car is turning left"</pre>	
13	time.sleep(1)	
14	PWM. setMotorModel (2000, 2000, -1500, -1500)	#Right
15	<pre>print "The car is turning right"</pre>	
16	time.sleep(1)	
17	PWM. setMotorModel(0,0,0,0)	#Stop
18	<pre>print "\nEnd of program"</pre>	
19	<pre>except KeyboardInterrupt:</pre>	
20	PWM. setMotorModel(0,0,0,0)	
21	<pre>print "\nEnd of program"</pre>	

Reference

setMotorModel(data1,data2,data3,data4)

This function has four input parameters that control the left front motor, the left rear motor, the right front motor, and the right rear motor. When the input parameter is within $0\sim4096$, the motor will rotate forward. If it is within $-4096\sim0$, the motor will rotate reversely. The larger the absolute value is, the faster the motor is. When the input is 0, the motor will stop. If the function is input as follows: setMotorModel(2000,2000, 2000, 2000), four motors will rotate forward and the car will move forward.

ADC Module

Run program

Enter the following commands to test ADC module.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

1. If not, execute the cd command:

cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server

2. Execute test.py command:

sudo python test.py ADC

pi@raspberrypi: ~/Freenove_4WDKit_for_Raspberry_Pi/Code/Server 🐱 🔺 🗙
File Edit Tabs Help
<pre>pi@raspberrypi:~ \$ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server ^ pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$ sudo python test.py ADC Program is starting The photoresistor voltage on the left is 2.96V The photoresistor voltage on the right is 2.91V The battery voltage is 8.13V</pre>
The photoresistor voltage on the left is 2.96V The photoresistor voltage on the right is 2.91V The battery voltage is 8.16V
The photoresistor voltage on the left is 2.96V The photoresistor voltage on the right is 2.91V The battery voltage is 8.16V ^C End of program pigreenhormumic (Encourse 4MD Smort Con Kit for Deenhormu Di(Code(Server 5
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

Result:

Every 1s, the voltage values of the two photoresistors and the battery are output. The value read for the first time is not stable and inaccurate when the chip just starts. It will be stable later. You can press "Ctrl + C" to end program.

The code is as below:

1	<pre>from ADC import *</pre>
2	adc=Adc()
3	<pre>def test_Adc():</pre>
4	try:
5	while True:
6	Left_IDR=adc.recvADC(0)
7	<pre>print ("The photoresistor voltage on the left is "+str(Left_IDR)+"V")</pre>
8	Right_IDR=adc.recvADC(1)
9	<pre>print ("The photoresistor voltage on the right is "+str(Right_IDR)+"V")</pre>
10	Power=adc.recvADC(2)
11	<pre>print ("The battery voltage is "+str(Power*3)+"V")</pre>
12	time.sleep(1)
13	print '\n'
14	except KeyboardInterrupt:
15	print "\nEnd of program"

Reference

recvADC(channel)

This function has only one input parameter, which can be 0, 1 or 2.

When the input is **0**, the value of this function is the voltage value of the **left** photoresistor.

When the input is 1, the value of this function is the voltage value of the **right** photoresistor.

When the input is **2**, the value of this function is the voltage value of **each battery**. After multiplying by 3, it is the actual battery voltage value

Infrared Line tracking module

Run program

Enter the following command in the terminal to test line tracking module.

If the terminal displays the directory as below (where test.py is located), you can **directly** execute the test.py command.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

1. If not, execute the cd command:

cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server

2. Execute test.py command:

sudo python test.py Infrared

```
pi@raspberrypi: ~/Freenove_4WD_..._Kit_for_Raspberry_Pi/Code/Server ~ ^ ×
File Edit Tabs Help
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python test.py Infrared
Program is starting ...
```

Result:

When the black line is on the left side of the module, the left LED will light up and the terminal will print "Left"; When the black line is in the middle of the module, the middle LED will light up and the terminal will print "Middle".

When the black line is on the right side of the module, right The LED will light up, the terminal will print "Right", You can press "Ctrl + C" to end the program.

The code is as below:

1	<pre>from Infrared_Obstacle_Avoidance import *</pre>
2	<pre>def test_Infrared():</pre>
3	try:
4	while True:
5	if GPIO.input(IR01)!=True and GPIO.input(IR02)==True and GPIO.input(IR03)!=True:
6	print 'Middle'
7	<pre>elif GPIO.input(IR01)!=True and GPIO.input(IR02)!=True and GPIO.input(IR03)==True:</pre>
8	print 'Right'
9	<pre>elif GPIO.input(IR01) == True and GPIO.input(IR02)!= True and GPIO.input(IR03)!= True:</pre>
10	print 'Left'
11	except KeyboardInterrupt:
12	<pre>print "\nEnd of program"</pre>

Need support? 🖂 support.freenove.com

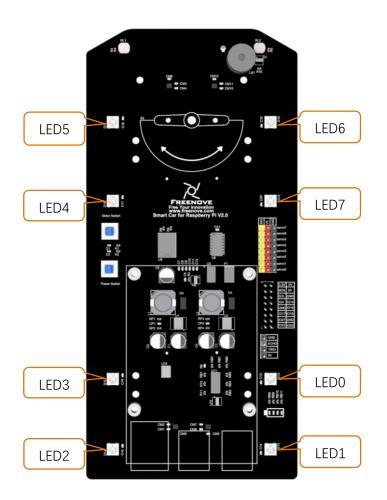

Reference

GPIO.input(IO)

This function has an input parameter. If the IO input is high level, GPIO.input(IO) returns True. If the IO input is low level, GPIO.input(IO) returns False.

LED

There are 8 RGB LEDs on the smart car board, as shownbelow. You can control them separately.

Run program

Enter the following commands to test LEDs.

If the terminal displays the directory as below (where test.py is located), you can **directly** execute the test.py command.

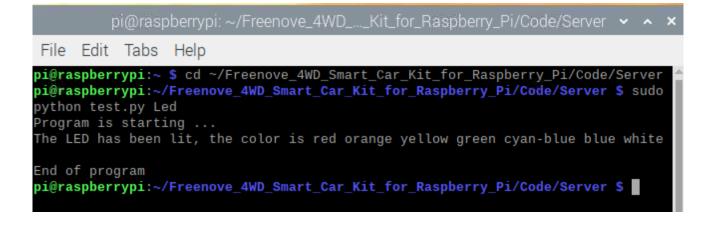

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

1.If not, execute the cd command:

cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server

2.Execute test.py command:

sudo python test.py Led

Result:

All LEDs will be turned on for 3 seconds, and colors from LED0 to LED7 are: red, orange, yellow, green, cyan, blue, purple, and white. You can end the program ahead of time by pressing "ctrl+c".

If the LED color display order is not correct, open the "**Led.py**" file in the current directory and modify the value of the "self.ORDER" variable on line 15.

The code of test.py is as below:

1	import time
2	try:
3	from Led import *
4	led=Led()
5	<pre>def test_Led():</pre>
6	try:
7	led.ledIndex(0x01, 255, 0, 0) #Red
8	led.ledIndex(0x02,255,125,0) #orange
9	led.ledIndex(0x04,255,255,0)
10	led.ledIndex(0x08,0,255,0) #green
11	led.ledIndex(0x10,0,255,255) #cyan-blue
12	led.ledIndex(0x20,0,0,255) #blue
13	led.ledIndex(0x40, 128, 0, 128)
14	led.ledIndex(0x80,255,255,255)
15	print "The LED has been lit, the color is red orange yellow green cyan-blue blue
16	white"
17	time.sleep(3) #wait 3s
18	<pre>led.colorWipe(led.strip, Color(0,0,0)) #turn off the light</pre>
19	print "\nEnd of program"
20	except KeyboardInterrupt:
21	<pre>led.colorWipe(led.strip, Color(0,0,0)) #turn off the light</pre>
22	print "\nEnd of program"
23	except:
24	pass

Reference

ledIndex(Index, R, G, B)

This function has 4 parameters.

The first one is the index of the LED that you want to control. Its value is hexadecimal. There are LED0~7. The rest 3 parameters are R G B value of color respectively.

For example, ledeindex(0x01,255,0,0) makes LED 0 light to red; ledeindex(0x40,0,255,0) makes LED 6 light green.

colorWipe(strip, color, wait_ms)

This function erases the color of one pixel at a time. It has three input parameters: strip represents the Neopixel object, color represents the color to be erased, and wait_ms represents the erasure interval. The default is 50ms. For example, colorWipe(strip, Color(255,0,0),20) means that the LED0 is red first, wait for 20ms, and then the LED1 is also red, until all eight LEDs are lit and red.

LED Show

Now we add some algorithms in this chapter to make the LED display more styles. You can take this as a reference, then you can use your imagination to write your own algorithm to achieve the LED styles you want. Run Program

If the terminal displays the directory as below, you can directly run the Led.py.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

1.If not, execute the cd command:

Reference

strip.setPixelColor(Index,color(R,G,B))

This is a function of WS2812 library. It is the same as the previously customized ledIndex() function. It is used to light up one LED and it has two input parameters. The first one is the LED number, the second one is used to set the color of the LED. For example, strip.setPixelColor(1,Color(255, 0, 0)), and write strip.show() in the next line, then LED1 will light red.

strip.show()

This function is of WS2812 library. When the LED color is set with the previous fuction, this function needs to be executed to make the LED show the corresponding color. If the color is set, but this function is not executed LED will not change color.

wheel(pos)

Generate rainbow colors in range of 0-255.

LED_TYPR(self,order,R_G_B)

Change the order in which the LED color data is transmitted. When the value of the order parameter is "RGB", the order of data transmission should be: R-G-B; when the value of the order parameter is "GBR", and the order of data transmission should be: G-B-R

theaterChaseRainbow(strip, wait_ms)

The function is used to make 8 LEDs show one color at the same time, and change to various colors to make a **blink**. The blinking interval is wait_ms, and its default value is 50ms.

rainbow(strip, wait_ms,)

This function achieves the effect of rainbow **breathing**. It makes 8 LEDs display **same** color simultaneously, and then change them all into various colors like breathing. The interval is wait_ms. The default value is 20ms.

rainbowCycle(strip, wait_ms)

This function also achieves the effect of rainbow **breathing**. but unlike rainbow(), it makes eight LEDs to display **different** colors at the same time, and then change them into various color separately. The interval is wait_ms. The default value is 20ms.

Result analysis

This code mainly achieves two LED effects, chasing animation and rainbow animation.

Chasing animation: first let the 8 LEDs light red one by one in turn, then green and blue. Interval is 50ms

between two LED, so the LED will display a round of red, then a round of green, and the last round of blue, like chasing. Then let the LEDs blink with different colors with an interval of 50ms, rendering a tense atmosphere, thus completing the chase animation.

Rainbow animation: The effect of the rainbow is different from the effect of blinking. The blinking is to make the LED on, off, on, and off. And the rainbow is to make LED on all the time, and switch between different colors, and the interval is shorter than the blinking. First, make the eight LEDs display one color at the same time and then change the color with intervals of 20ms. And then make the eight LEDs display different colors at the same time, and then change the color to produce another rainbow effect.

Buzzer

Run the program

Enter the following command in the terminal to test buzzer.

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server	rt Car Kit for Raspberry Pi/Code/Server \$
--	--

1.If not, execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2.Execute test.py command:

sudo python test.py Buzzer

pi@raspberrypi: ~/Freenove_4WD_..._Kit_for_Raspberry_Pi/Code/Server 👻 🔺 🗙

<u>File Edit Tabs H</u>elp

```
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server ^
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python test.py Buzzer
Program is starting ...
1S
2S
3S
End of program
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

Result:

The buzzer will be turned on and last for 3s. Then the program will automatically end or you can press "Ctrl + C" to end the program.

The code is as below:

```
1 from Buzzer import *
2 buzzer=Buzzer()
3 def test_Buzzer():
4 try:
5 buzzer.run(cmd.CMD_START)
```

6	time.sleep(1)
7	print "1S"
8	time.sleep(1)
9	print "2S"
10	time.sleep(1)
11	print "3S"
12	buzzer.run(cmd.CMD_STOP)
13	<pre>print "\nEnd of program"</pre>
14	except KeyboardInterrupt:
15	buzzer.run(cmd.CMD_STOP)
16	<pre>print "\nEnd of program"</pre>

Reference

buzzer.run(cmd)

This function has one input parameter. If the input is '1', the buzzer will be turned on. If the input is '0', the buzzer will be turned off.

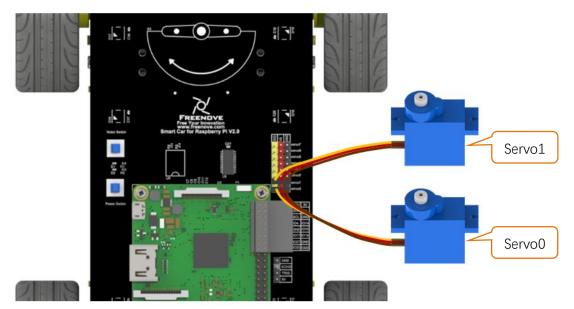

Servo

Run program

In the first chapter, we did not install the Pan-Tilt. Because we need to run programs for the installation of the servos to ensure that the servos rotate to the correct angle.

Next let us install the Pan-Tilt.

Connect two servos to port Servo0 and port Servo1 on the smart car board. And please remember the numbers of the servos.

Enter the following command in the terminal:

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

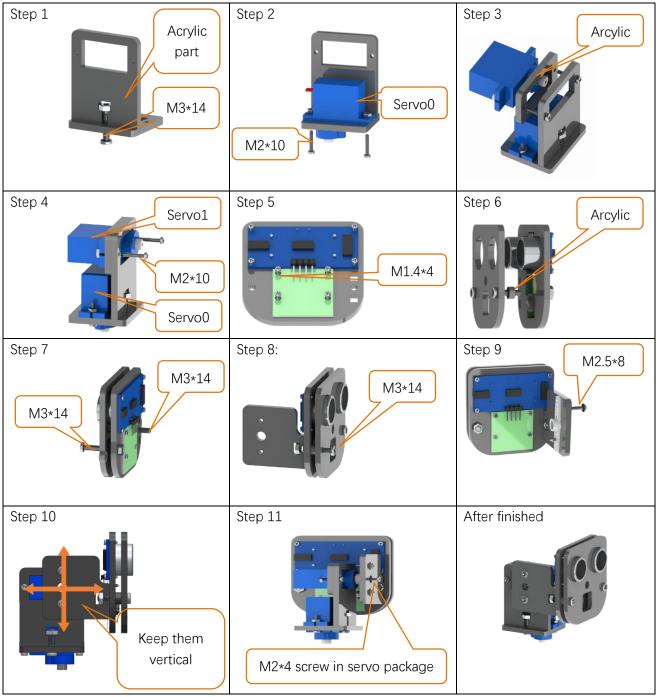

1.If not, execute the cd command:

cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server

2.Execute Servo.py command:

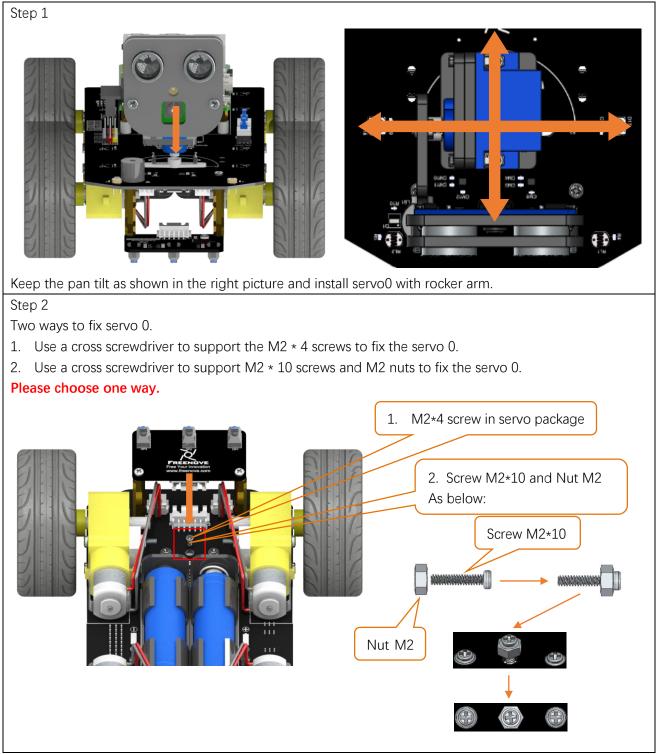

sudo python servo.py

Then servos rotate to a proper angle. Please keep the connection between the servos and the smart car board.

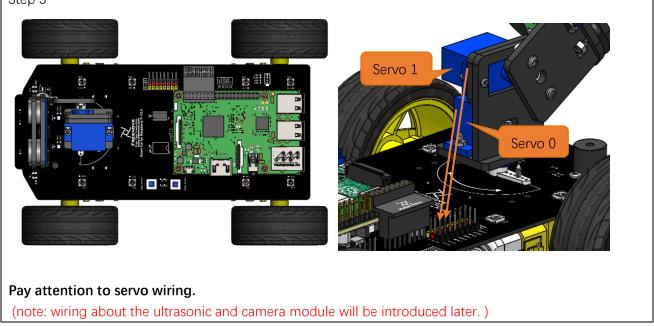

Installation steps: (Note: Do not disorder Servo0 and Servo1 during the installation.)

Install Pan Tilt on smart car board.

Enter the following commands in the terminal to test servos.

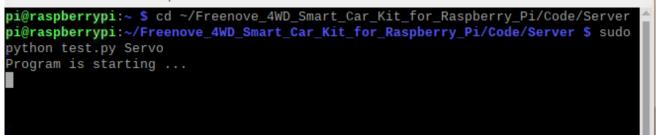

If the terminal displays the directory as below (where test.py is located), you can **directly** execute the test.py command.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

- 1. If not, execute the cd command:
 - cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
- 2. Execute test.py command: sudo python test.py Servo

pi@raspberrypi: ~/Freenove_4WD_..._Kit_for_Raspberry_Pi/Code/Server 🗸 🔺 🗙

File Edit Tabs Help

Result:

The servo 0 repeats rotating from left to right and then from right to left. The servo 1 repeats rotating from bottom to top and then from top to bottom. You can press "Ctrl + C" to end the program.

The code is as below:

1	<pre>from servo import *</pre>
2	pwm=Servo()
3	<pre>def test_Servo():</pre>
4	try:
5	while True:
6	for i in range(50,110,1):
7	<pre>pwm.setServoPwm('0', i)</pre>
8	time.sleep(0.01)
9	for i in range(110,50,-1):
10	<pre>pwm.setServoPwm('0', i)</pre>
11	time.sleep(0.01)
12	for i in range (80, 150, 1):
13	<pre>pwm.setServoPwm('1',i)</pre>
14	time.sleep(0.01)
15	for i in range (150, 80, -1):
16	<pre>pwm.setServoPwm('1',i)</pre>
17	time.sleep(0.01)
18	except KeyboardInterrupt:
19	pwm.setServoPwm('0',90)
20	pwm.setServoPwm('1',90)
21	<pre>print "\nEnd of program"</pre>

Reference

setServoPwm(Servo,angle)
There are 2 parameters.
The first one is related to servo index.
The second one is related to the angle of serve
For example,
setServoPwm('0',20) makes servo0 rotate to 20
setServoPwm('1',90) makes servo1 rotate to 90

Ultrasonic module

Next, use jumper wires F/F to connect ultrasonic module with pins on smart car board.

When connecting the ultrasonic module, you need **disconnect** the **Servo1** cable, so that the servo can rotate freely, and after the wiring is completed, connect the servo cable again. When wiring, you should keep the silk screen of the ultrasonic module and the smart car board consistent. Vcc should be connected to 5V, Trig to TRIG, Echo to ECHO, and Gnd to GND.

If the connection is wrong, for example, if Vcc is connected to GND, and Gnd is connected to 5V, it will cause the damage to ultrasonic module. After the wiring is completed, you can start testing.

Run program

Enter following command in the terminal:

If the terminal displays the directory as below (where test.py is located). You can **directly** execute the test.py command.

pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

- 1. If not, execute the cd command:
 - cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
- 2. Execute test.py command:
 - sudo python test.py Ultrasonic

pi@raspberrypi: ~/Freenove_4WDKit_for_Raspberry_Pi/Code/Server 👻 🔺 🗙
File Edit Tabs Help
<pre>pi@raspberrypi:~ \$ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server ^ pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$ sudo python test.py Ultrasonic Program is starting Obstacle distance is 21CM Obstacle distance is 596CM Obstacle distance is 660CM Obstacle distance is 7CM</pre>
Obstacle distance is 3CM Obstacle distance is 285CM Obstacle distance is 7CM Obstacle distance is 8CM Obstacle distance is 7CM Obstacle distance is 110CM Obstacle distance is 363CM Obstacle distance is 353CM
^C End of program pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$

Result:

Every 1s, the distance between the obstacle and the ultrasonic module will be printed out, and you can press "Ctrl + C" to end the program.

The code is as below:

1	<pre>from Ultrasonic import *</pre>	
2	ultrasonic=Ultrasonic()	
3	<pre>def test_Ultrasonic():</pre>	
4	try:	
5	while True:	
6	<pre>data=ultrasonic.get_distance() #Get the value</pre>	
7	<pre>print ("Obstacle distance is "+str(data)+"CM")</pre>	
8	time.sleep(1)	
9	<pre>except KeyboardInterrupt:</pre>	
10	<pre>print "\nEnd of program"</pre>	

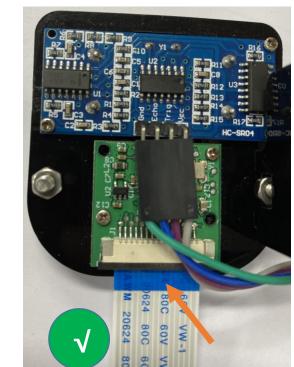

Reference

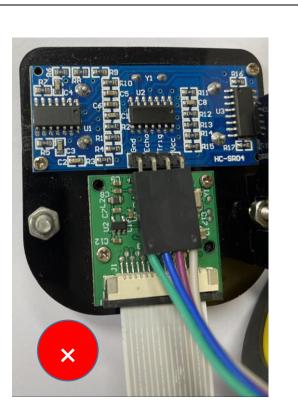

get_distance() This function is used to obtain the distance between ultrasonic module and obstacles in front of it, with unit CM.

Camera

Next let us connect the camera to smart car board. First **turn off S1** (Power Switch), **shut down Raspberry Pi** and disconnect power cable. If the data cable is used to power the Raspberry Pi, disconnect the data cable and install the CSI camera to the Raspberry Pi camera interface when the Raspberry Pi is powered off. (**The CSI camera must be connected or disconnected under no power and when Raspberry Pi is shut down, or the camera may be burned.**)

Step 1

The Blue side of cable should be toward to Servo. Connect one end of cable to camera. Please note the front and back of the cable.

Step 2

The Blue side of cable should be toward to RPi USB port.

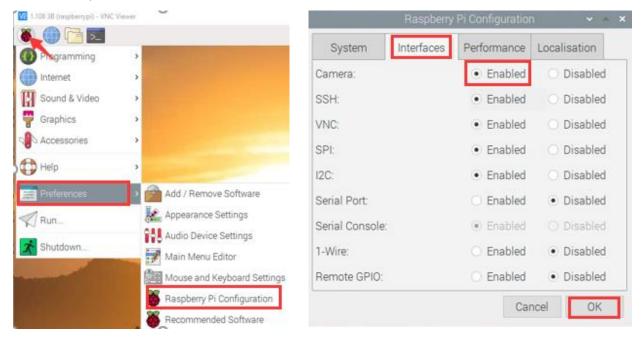

Connect another end of cable to raspberry pi. Please note the front and back of the cable.

Enable camera

Turn on S1 or use cable to power Raspberry Pi, and start it.

If you are using remote desktop mode to login Raspberry Pi, you need use <u>VNC viewer</u>.

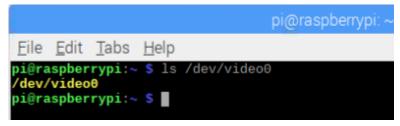

Then follow steps below to enable camera:

Then reboot Raspberry Pi and enter following commands:

ls /dev/video0

Then the device code will be shown below:

Run program

1. execute the cd command:

```
cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

- 2. Execute test.py command:
 - raspistill -o image.jpg

Then please open and check the generated image.jpg under

/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server.

Chapter 4 Light tracing Car

If you have any concerns, please feel free to contact us via support@freenove.com

Description

The light-tracing function of the car mainly uses a photoresistor. The car has two photoresistors located at both ends in the front to detect light.

A photoresistor is a resistor based on the photoelectric effect of the semiconductor. The resistance changes with the intensity of the incident light. With the incident light intensity increasing, the resistance decreases. With the incident light intensity decreasing, the resistance increases.

And the change of the resistance value also causes voltage applied to the photoresistor changes. According to the change of voltage, the position of the light to the car will be detected, and then make the car move corresponding action to trace light.

Put your car in a darker environment.

Run program

If the terminal displays the directory as below, you can **directly** execute the Light.py command.

p	i@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$			
1	. If not, execute the cd command:			
	cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server			
2	2. Run Light.py:			
	sudo python Light.py			
	pi@raspberrypi: ~/Freenove_4WDKit_for_Raspberry_Pi/Code/Server 🐱 🔺 🗙			
	File Edit Tabs Help			
P	<pre>pi@raspberrypi:~ \$ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server ^ pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$ sudo bython Light.py Program is starting</pre>			

You can press "Ctrl + C" to end the program.

The code is below:

1	import time
2	<pre>from Motor import *</pre>
3	<pre>from ADC import *</pre>
4	class Light:
5	<pre>def run(self):</pre>
6	try:
7	<pre>self.adc=Adc()</pre>
8	<pre>self.PWM=Motor()</pre>
9	<pre>self.PWM. setMotorModel(0,0,0,0)</pre>
10	while True:
11	L = self.adc.recvADC(0)
12	R = self.adc.recvADC(1)
13	if L $<$ 2.99 and R $<$ 2.99 :
14	self.PWM.setMotorModel(600,600,600,600)
15	
16	elif abs(L-R)<0.15:
17	<pre>self.PWM.setMotorModel(0,0,0,0)</pre>
18	
19	elif $L > 3$ or $R > 3$:
20	if $L > R$:
21	self.PWM. setMotorModel (-1200, -1200, 1400, 1400)
22	
23	elif $R > L$:
24	self.PWM. setMotorModel (1400, 1400, -1200, -1200)
25	
26	<pre>except KeyboardInterrupt:</pre>
27	led_Car.PWM. setMotorModel(0,0,0,0)
28	
29	ifname=='main':
30	<pre>print ('Program is starting ')</pre>
31	led_Car=Light()
32	led_Car.run()

Result analysis

When the voltages of left and right photoresistor are less than 2.99V, the car move forward straightly. And when one of the voltages is greater than 3V:

If the left voltage is greater than the right, the car turns left.

If the right voltage is greater than the left, the car turns right.

You can change the judgment of the program to achieve the result you want, according to the light intensity of the environment.

Chapter 5 Ultrasonic Obstacle Avoidance Car

If you have any concerns, please feel free to contact us via support@freenove.com

Description

The obstacle avoidance function of the car mainly uses the HC-SR04 ultrasonic module. The ultrasonic module is controlled by the servo. The servo rotates to the left, middle and right repeatedly, so that the ultrasonic module measures the distance of obstacles on the left, middle and right directions. And then it controls the car to move according to different distances.

Run program

If the terminal displays the directory as below, you can **directly** run the Ultrasonic.py.

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
1. If not, execute the cd command:
    cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
```

2. Run Ultrasonic.py:

sudo python Ultrasonic.py

pi@raspberrypi: ~/Freenove_4WD_..._Kit_for_Raspberry_Pi/Code/Server 🐱 🔺 🤅

<u>File Edit Tabs H</u>elp

```
pi@raspberrypi:~ $ cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server ^
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $ sudo
python Ultrasonic.py
Program is starting ...
```

You can press "Ctrl + C" to end the program. Part of code is as below:

1	<pre>def run(self):</pre>		
2	<pre>self.PWM=Motor()</pre>		
2 3	<pre>self.pwm_S=Servo()</pre>		
4	for i in range(30, 151, 60):		
5	<pre>self.pwm_S.setServoPwm('0',i)</pre>		
6	time.sleep(0.2)		
7	if i==30:		
8	L = self.get_distance()		
9	elif i==90:		
10	<pre>M = self.get_distance()</pre>		
11	else:		
12	<pre>R = self.get_distance()</pre>		
13	while True:		

14 for i in range (90, 30, -60): 15 self.pwm_S.setServoPwm('0',i) 16 time. sleep(0, 2)17 **if** i==30: 18 L = self.get_distance() 19 elif i==90: 20 M = self.get_distance() 21 else: 22 R = self.get_distance() 23 self.run_motor(L, M, R) 24 for i in range (30, 151, 60): 25 self.pwm_S.setServoPwm('0',i) 26 time.sleep(0.2)**if** i==30: 27 28 L = self.get_distance() 29 elif i==90: 30 M = self.get_distance() 31 else: 32 R = self.get_distance() 33 self.run_motor(L,M,R) 34 ultrasonic=Ultrasonic() 35 # Main program logic follows: 36 if name == ' main ': 37 print ('Program is starting ... ') 38 try: 39 ultrasonic.run() except KeyboardInterrupt: # When 'Ctrl+C' is pressed, the child program destroy() will be 40 41 executed. 42 PWM. setMotorModel (0, 0, 0, 0) 43 ultrasonic.pwm S. setServoPwm('0',90)

Result analysis

Let servo0 rotate back and forth to 30 degrees, 90 degrees and 150 degrees respectively. And the ultrasonic module also follows the movement to measure the obstacle distance of these three angles.

When distances detected on the left>30cm, middle >30cm, right>30cm. It means that there is no obstacle within 30cm. So the car move forward.

When distances detected on the left<30cm, middle <30cm, right<30cm, it means that the car enters a dead end, so the car move back and turned back.

When distances detected on the left<30cm, middle <30cm, right>30cm. It means that there is an obstacle on the left side of the car, so the car turn right.

When distances detected on the left>30cm, middle <30cm, right<30cm. It means that there is an obstacle on the right side of the car, so the car turn left.

Chapter 6 Infrared Line Tracking Car

If you have any concerns, please feel free to contact us via support@freenove.com

Description

The line tracing function of the car mainly uses an infrared module. When the sensor detects black line, the corresponding LED will light up, which controls the car to move according to the value of three sensors.

Run program

If the terminal displays the directory as below, you can **directly** run the program.

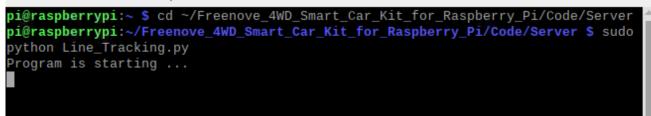

```
pi@raspberrypi:~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server $
```

 If not, execute the cd command: cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server

Result analysis

There are 3 sensors on the left, middle and right. When the black line is detected by a sensor, it will show high level, or it is low.

When the sensor on left: high, middle: low, right: low, the car turns left lightly.

When the sensor on left: high, middle: high, right: low, the car turns left.

When the sensor on left: low, middle: high, right: low, the car moves forward straight.

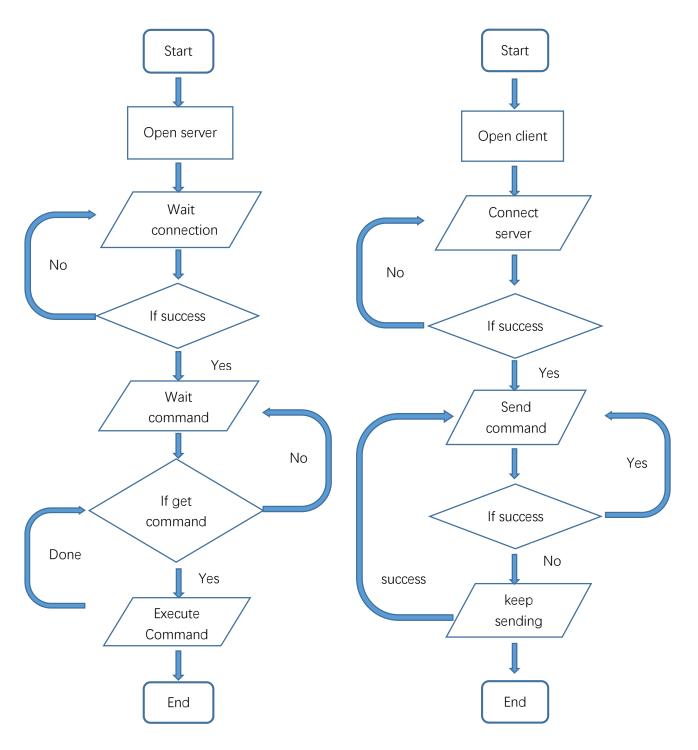

When the sensor on left: low, middle: low, right: high, the car turns right lightly.

When the sensor on left: low, middle: high, right: high, the car turns right.

Chapter 7 Smart video car

If you have any concerns, please feel free to contact us via support@freenove.com

The smart video car integrates the previous functions of light tracing, obstacle avoidance, line tracing, video transmission, face detection, LED and so on. And it is built with a server and a client, so it can be controlled remotely.

Server

The server works on the Raspberry Pi and can transmit camera data, ultrasonic data, etc. to the client, and it can also receive commands from the client.

In the Server folder, there is a server.py file which contains main server code.

get_interface_ip() is used to get IP address of the native Raspberry Pi wlan0, without manually modifying the code to set IP parameters.

StartTcpServer() is used to start the TCP service. The channel of port 5000 is mainly used to send and receive commands between the client and the server. The channel of port 8000 is used for the server to transmit the collected camera data to the client.

StopTcpServer() is used to stop the TCP service.

sendvideo() is used to sends the camera data.

Part of server code is as follows:

1	<pre>def get_interface_ip(self):</pre>		
2	s = socket.socket(socket.AF_INET, socket.SOCK_DGRAM)		
3	<pre>return socket.inet_ntoa(fcntl.ioctl(s.fileno(), 0x8915, struct.pack('256s',</pre>		
4	"wlan0" [:15]))[20:24])		
5	<pre>def StartTcpServer(self):</pre>		
6	<pre>HOST=str(self.get_interface_ip())</pre>		
7	<pre>self.server_socket1 = socket.socket()</pre>		
8	<pre>self.server_socket1.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEPORT, 1)</pre>		
9	<pre>self.server_socket1.bind((HOST, 5000))</pre>		
10	<pre>self.server_socket1.listen(1)</pre>		
11	<pre>self.server_socket = socket.socket()</pre>		
12	<pre>self.server_socket.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEPORT, 1)</pre>		
13	<pre>self.server_socket.bind((HOST, 8000))</pre>		
14	<pre>self.server_socket.listen(1)</pre>		
15	<pre>print('Server address: '+HOST)</pre>		
16			
17	<pre>def StopTcpServer(self):</pre>		
18	try:		
19	<pre>self.connection.close()</pre>		
20	<pre>self.connection1.close()</pre>		
21	except Exception , e:		
22	<pre>print "No client connection"</pre>		
23			
24	<pre>def sendvideo(self):</pre>		
25	try:		
26	<pre>self.connection, self.client_address = self.server_socket.accept()</pre>		
27	<pre>self.connection=self.connection.makefile('rb')</pre>		
28	except:		
29	pass		

```
30
              self.server_socket.close()
31
              try:
32
                  with picamera. PiCamera() as camera:
33
                      camera.resolution = (400, 300)
                                                          # pi camera resolution
34
                      camera.framerate = 30
                                                           # 15 frames/sec
35
                      time.sleep(2)
                                                           # give 2 secs for camera to initilize
36
                      start = time.time()
37
                      stream = io.BytesIO()
38
                      # send jpeg format video stream
39
                      print "Start transmit ... "
40
                      for foo in camera.capture_continuous(stream, 'jpeg', use_video_port = True):
41
                          try:
42
                              self.connection.flush()
43
                              stream.seek(0)
44
                              b = stream.read()
                              lengthBin = struct.pack('L', len(b))
45
46
                              self.connection.write(lengthBin)
47
                              self.connection.write(b)
                              if time.time() - start > 600:
48
49
                                  break
50
                              stream.seek(0)
51
                              stream. truncate()
52
                          except :
                              print "End transmit ... "
53
54
                              break
55
              except:
56
                  print "Camera unintall"
```

Open Server

If you are using **remote desktop mode** to login Raspberry Pi, you need use <u>VNC viewer</u>. Enter the following command in the terminal.

- 1. Use cd command to enter directory where main.py is located:
- cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
- 2. Run main.py:

sudo python main.py

pi@raspberrypi: ~/Freenove_Four_whee...t_Car_Kit_for_Raspberry_Pi/Code/Server 👻 🔺

File Edit Tabs Help

pi@raspberrypi:~ \$ cd ~/Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi/Code/Server ^
pi@raspberrypi:~/Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi/Code/Server \$ sudo
python main.py

The interface is as below:

Click "On" to open the server.

If you don't like the interface, you can also enter the commands to open the server. It is more convenient.

- 1. Use cd command to enter directory where main.py is located:
 - cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server
- 2. Run main.py:
 - sudo python main.py -t -n

or Run main,py with following command:

- sudo python main.py -tn
- "-t" means open TCP communication. "-n" means don't show interface.

Part of client code is as below:

Client

The client connects to the server through TCP, which receives the video stream from the server, and other commands. And it also sends commands to the server to control the car.

Clients can run on different systems, such as windows, Linux, and so on. However, you need to install related software and libraries.

The related program is mainly in the Video.py file under the Client folder.

1	class VideoStreaming:	
2	<pre>definit(self):</pre>	
3	<pre>self.face_cascade = cv2.CascadeClassifier(r'haarcascade_frontalface_default.xml')</pre>	
4	<pre>self.video_Flag=True</pre>	
5	<pre>self.connect_Flag=False</pre>	
6	<pre>self.face_x=0</pre>

              try:
49
                  self.client_socket.connect((ip, 8000))
50
                  self.connection = self.client_socket.makefile('rb')
51
              except:
52
                  #print "command port connect failed"
53
                  pass
54
              while True:
55
                  try:
56
                       stream_bytes= self.connection.read(4)
57
                       leng=struct.unpack('L', stream bytes[:4])
                       jpg=self.connection.read(leng[0])
58
59
                       if self.IsValidImage4Bytes(jpg):
60
                                   image = cv2.imdecode(np.frombuffer(jpg, dtype=np.uint8),
61
      cv2. IMREAD_COLOR)
62
                                   if self.video_Flag:
63
                                       self.face_detect(image)
64
                                       self.video_Flag=False
65
                  except:
66
                     break
```

Run client on windows system

There are two ways to run Client on Windows.

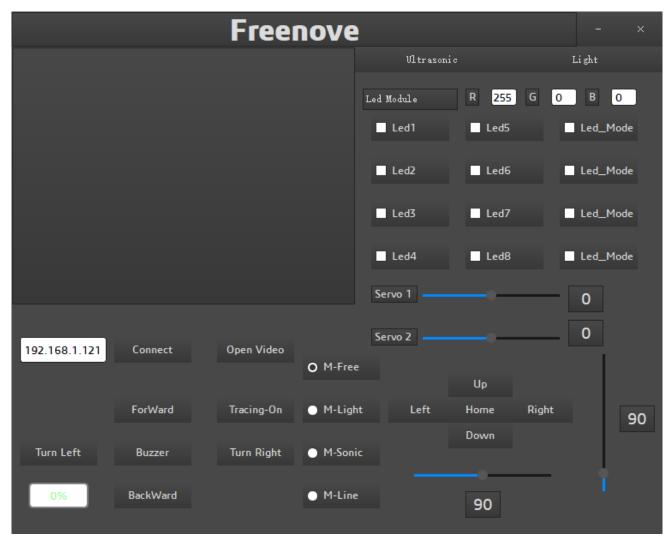

Option 1 Running executable file directly

Find the "Client.exe" file in the specified directory, double click it and the Client is opened.

The client interface is shown as below:

After the client opens successfully, you need open the Raspberry Pi and <u>open server first</u>, then enter the IP address of the Raspberry Pi in the white IP edit box, and then click "Connect" to connect smart car to Raspberry Pi. After the connection is successful, you can click on the controls on the interface to operate the car. Note: when Raspberry Pi is shut down, server will be closed. You need open server again the next time. If pressing forward but the car moves backward, please refer to page 51 to modify the code.

Option 2 Install python3 and some related python libraries to run the client

If you want to modify the client, please follow this section.

This section will be completed in your computer with windows system, not Raspberry Pi.

There are many relevant software and libraries needed to be installed in Windows system, which takes a long time. At this time, it does not need to run Server or use Raspberry Pi. You can shut down Raspberry Pi first. After the installation is completed, you need to open Raspberry Pi and server again.

Install python3 Download the installation file: https://www.python.org/downloads/windows/

About	Downloads	Documentation	
Python >>> Downloads >>> Windows			
Python Releases for Windows			

- Latest Python 3 Release Python 3.8.1
- Latest Python 2 Release Python 2.7.17

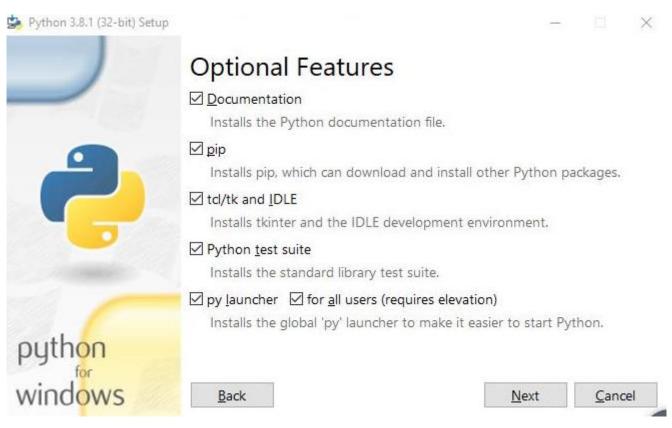

Click Latest Python 3 Release - Python 3.8.1

Version	Operating System	Description
Gzipped source tarball	Source release	
XZ compressed source tarball	Source release	
macOS 64-bit installer	Mac OS X	for OS X 10.9 and later
Windows help file	Windows	
Windows x86-64 embeddable zip file	Windows	for AMD64/EM64T/x64
Windows x86-64 executable installer	Windows	for AMD64/EM64T/x64
Windows x86-64 web-based installer	Windows	for AMD64/EM64T/x64
Windows x86 embeddable zip file	Windows	
Windows x86 executable installer	Windows	
Windows x86 web-based installer	Windows	

Choose and download Windows x86 executable installer. After downloading successfully, install it.

Select "Add Python 3.8 to PATH". You can choose other installation features.

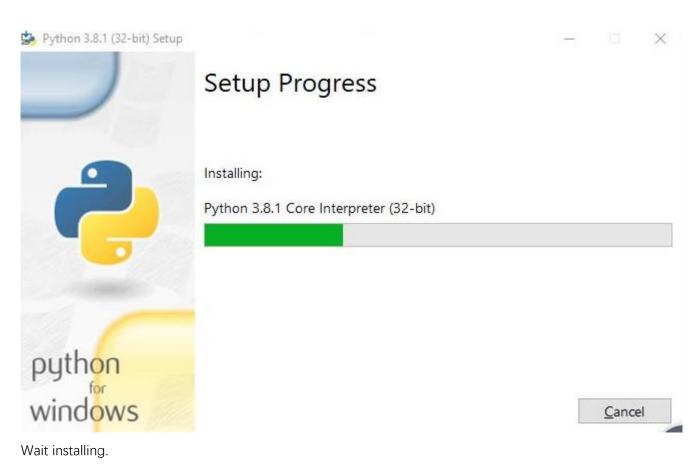

Select all options and click "Next".

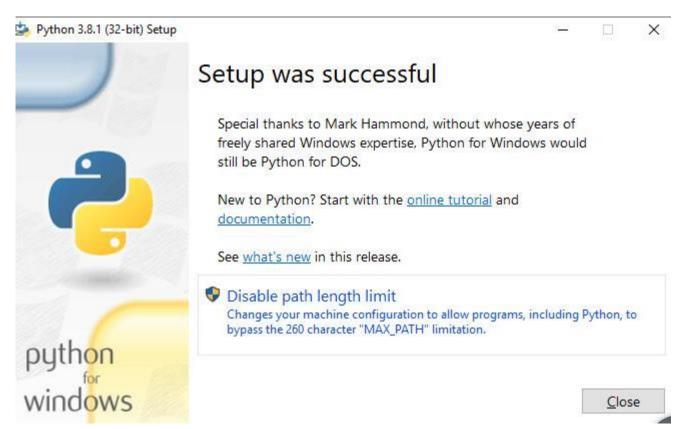

www.freenove.com

Python 3.8.1 (32-bit) Setup				×			
	Advanced Options						
	Install for <u>all</u> users						
	Associate files with Python (requires the py launcher)						
	Create shortcuts for installed applications						
-	Add Python to environment variables						
	Precompile standard library						
	Download debugging symbols						
-	Download debug binaries (requires VS 2015 or later)						
	Customize install location						
	D:\		B <u>r</u> owse				
python							
windows	Back 🔮 Insta	all	<u>C</u> ancel				

Here, my install location is D. You can also choose other location. Then click "Install".

Need support? 🖂 support.freenove.com

Now, installation is completed.

Install PyQt5, opencv, numpy and other libraries.

If have not download the zip file, do so via:

https://github.com/Freenove/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/archive/master.zip Then unzip it and delete "-master" to rename it to "Freenove_Robot_Dog_Kit_for_Raspberry_Pi". Then put it into D disk for example.

You can also place it into other disks (like E), but the path in the following command should be modified accordingly (replace D: by E:).

Press "win + R" and enter cmd, and click ok. Then enter following commands.

- 1. Enter D disk. (If you put it into E, it should be E:)
 - D:
- Enter directory where setup_windows.py is located: (If you put it into E, it should be E:) cd D:\Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code

3. Run setup_windows.py:

Python3 setup_windows.py

C:\Users\Freenove>D:

D:\>cd D:\Freenove_4\D_Smart_Car_Kit_for_Raspberry_Pi\Code

D:\Freenove_4\D_Smart_Car_Kit_for_Raspberry_Pi\Code>Python3 setup_windows.py

Or enter the unzipped directory Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code\Client. And double-click **setup_client.py** or open it with python3.

Installation will take some time. Just wait patiently. For successful installation, it will prompt "All libraries installed successfully":

Package	Version
Click	7.0
numpy	1.18.1
opencv-python	4.1.2.30
Pillow	7.0.0
pip	19.2.3
PyQt5	5.13.2
PyQt5-sip	12.7.0
pyqt5-tools	5.13.2.1.6rc1
python-dotenv	0.10.3
setuptools	41.2.0

If not all installations are successful, it will prompt "Some libraries have not been installed yet. Please run ' Python3 setup_windows.py ' again", then you need to execute the Python3 setup_windows.py command again. Most of the installation failures are caused by poor networks. You can check your network before installing.

Open client

Press "win + R" and enter cmd, and click ok. Then enter following commands.

- 1. Enter D disk. If you put it into E, it should be E:
- D:
- 2. Enter directory where Main.py is located:
 - cd D:\Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code\Client
- 3. Run Main.py: python Main.py

C:\Users\Freenove>D:

D:\>cd D:\Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi\Client

D:\Freenove_Four_wheeled_Smart_Car_Kit_for_Raspberry_Pi\Client>python Main.py_

Or enter the unzipped directory and enter following directory:

Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi\Code\Client. And double-click **Main.py** or open it with python to open the client.

The client interface is shown as below:

		Free	nove	2			-	×
				Ultrasor	nic	1	Light	
				Led Module	R 255	G 0	В	0
				Led1	Led5		Led_M	1ode
				Led2	Led6		Led_M	1ode
				Led3	Led7		Led_M	1ode
				Led4	Led8		Led_M	1ode
				Servo 1			0

Turn Left	Buzzer	Turn Right	M-Son	ic	Down			
0%	BackWard		O M-Lin	e	90		Ĩ	

After the client opens successfully, you need open the Raspberry Pi and <u>open server first</u>, then enter the IP address of the Raspberry Pi in the white IP edit box, and then click "Connect" to connect smart car to Raspberry Pi. After the connection is successful, you can click on the controls on the interface to operate the car. **Note: when Raspberry Pi is shut down, server will be closed. You need open server again the next time.**

If pressing forward but the car moves backward, please refer to page 51 to modify the code.

Control

And you can also control the car with following blue keys.

The car has four work modes:

Mode	Function
M-Free (Mode1)	Free control mode
M-Light (Mode2)	Light tracing mode
M-Sonic (Mode3)	Ultrasonic obstacle avoidance mode
M-Line (Mode4)	Infrared line tracking mode

The following is the corresponding operation of the buttons and keys.

Button on Client	Кеу	Action
ForWard	W	Move
BackWard	S	Back off
Turn Left	А	Turn left
Turn Right	D	Turn right
Left	left arrow	Turn camera left
Right	right arrow	Turn camera right
Up	up arrow	Turn camera up
Down	down arrow	Turn camera down
Home	Home	Turn camera back Home
Connect/ Disconnect	С	On/off Connection
Open Video/ Close Video	V	On/off Video
Mode 1,2,3,4	Q	Switch Mode
Buzzer	Space	On/off Buzzer
Led 1,2,3,4,5,6,7,8	1,2,3,4,5,6,7,8	On/off Led 1,2,3,4,5,6,7,8
Led_Mode 1,2,3,4	L	Switch Led Mode

The function of SliderBar is below:

SliderBar	Function
Servo 1,2,	SliderBar Servo 1, 2 are used to slightly adjust the
	angle. If the servo is not fully centered during
	installation, you can slightly tune it via the SliderBar.

Other control information:

Control	Function
IP address Edit box	Enter IP address of Raspberry Pi
Power box	Show power level
R,G,B Edit box	Control the color of LED selected.
Button "Ultrasonic"	Show the distance from obstacle.
Button "Light "	Show voltage of two photoresistors.
Button "Tracing-On/Off "	Open and close face tracking

If you don't want to enter IP address after open the client, you can make some modification as below:

- 1. Open "Client_Ui.py" under directory "Client", then find code in the thirty-sixth line from the bottom.
- self.IP.setText(_translate("Client", "IP address", None))
- 2. Modify IP address to IP address of your raspberry pi. For example, my rpi IP is 192.168.1.116. After modification, it should be as below:
 - self.IP.setText(_translate("Client", "192.168.1.116", None))

Then save and close. And then restart your client. You can see it is modified successfully.

Run client on macOS system

Here take MacOS 10.13 as an example. To run the client on MacOS, you need to install some software and libraries. At this time, it does not need to run the server or use the Raspberry Pi. So you can turn off the Raspberry Pi first. After the installation is complete, turn on the Raspberry Pi and run the server. MacOS 10.13 comes with python2, but no python3. However, the programs in this project need run under python3, so you need to install it first.

Install python3

Download installation package, link: https://www.python.org/downloads/

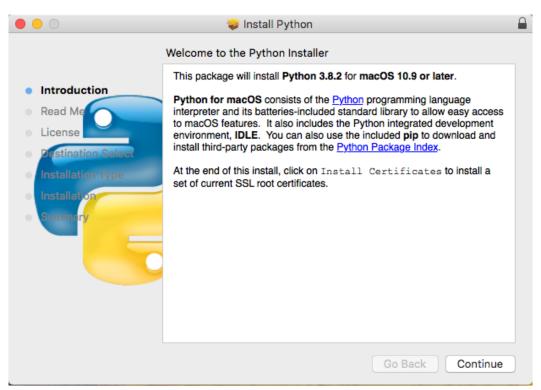

Release version	Release date	
Python 3.8.2	Feb. 24, 2020	🕹 Download
Python 3.8.1	Dec. 18, 2019	🕹 Download
Python 3.7.6	Dec. 18, 2019	🕹 Download
Python 3.6.10	Dec. 18, 2019	🕹 Download
Python 3.5.9	Nov. 2, 2019	🕹 Download
Python 3.5.8	Oct. 29, 2019	🕹 Download

Click Python 3.8.2.

Version	Operating System	Description

	💝 Install Python	
	Software License Agreement	
 Introduction Read Me License Destination Solect Installation Type 	HISTORY AND LICENSE HISTORY OF THE SOFTWARE Python was created in the early 1990s by Guido van Rossum at Stichting Mathematisch Centrum (CWI, see http://www.cwi.nl) in the Netherlands as a successor of a language called ABC. Guido remains Python's principal author, although it includes many contributions from others.	
 Installation Summary 	In 1995, Guido continued his work on Python at the Corporation for National Research Initiatives (CNRI, see http://www.cnri.reston.va.us) in Reston, Virginia where he released several versions of the software. In May 2000, Guido and the Python core development team moved to BeOpen.com to form the BeOpen PythonLabs team. In October of the same year, the PythonLabs team moved to Digital Creations (now Zope Corporation, see http://www.zope.org). In 2001, the Python Software Foundation (PSF, see http://www.python.org/psf/) was formed, a non-profit organization created specifically to own Python- related Intellectual Property. Zope Corporation is a sponsoring member of the PSF.

Open the Terminal.

Ele etile	Terminal	
🌸 💭 🔽 🧔 🛞	0 🗋 🛔	

Type following commands in Terminal.

1.Enter "Downloads", (Where the Car code is located. If your location for it is different, please enter the location in your device.)

cd Downloads

2.Enter directory where setup_macos.py is located:

cd Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/

3.Run setup_macos.py:

python3 setup_macos.py

```
.....
```

Code - Python • Python setup_macos.py - 86×24

```
Last login: Mon Mar 2 18:56:17 on ttys000
[mac13deMac:~ mac10.13$ cd Downloads
[mac13deMac:Downloads mac10.13$ cd Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/
[mac13deMac:Code mac10.13$ python3 setup_macos.py
```

Installation will take some time. Just wait patiently. For successful installation, it will prompt "All libraries installed successfully":

Package	Version
numpy	1.18.1
opencv-python-headless	4.2.0.32
Pillow	7.0.0
pip	20.0.2
PyQt5	5.14.1
PyQt5-sip	12.7.1
setuptools	41.2.0

All libraries installed successfully mac13deMac:Code mac10.13\$

If not all installations are successful, it will prompt "Some libraries have not been installed yet. Please run 'python3 setup_macos.py' again", then you need to execute the python3 setup_macos.py command again. Most of the installation failures are caused by poor networks. You can check your network before installing.

Open client

Following the previous step, after the installation is completed, you are now in the directory where setup_macos.py is located.

Package	Version
numpy	1.18.1
opencv-python-headless	4.2.0.32
Pillow	7.0.0
pip	20.0.2
PyQt5	5.14.1
PyQt5-sip	12.7.1
setuptools	41.2.0

All libraries installed successfully mac13deMac:Code mac10.13\$

1. Type following command to enter Client folder.

cd Client/

2.Type following command to run Main.py.

python3 Main.py

The control way of Raspberry Pi macOS System client is same with Windows (Control).

Run client in Raspberry Pi (Linux system)

Install Opencv library

Execute the following commands in the terminal to install Opencv library:

- Install opencv development environment: sudo apt-get install -y libopencv-dev python3-opencv
- Install some tools: sudo apt-get install -y python3-pil python3-tk

Run client

Enter the following commands at the terminal.

- 1. Use the cd command to go to the directory where Main.py is located.
- cd ~/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Client
- 2. Run Main.py:
 - sudo python Main.py

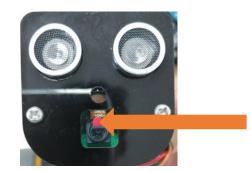

The interface is shown below:

		þ	oi@raspberr	/pi: ~/F	Freenove_4W	'Dr_	_Kit_for_	Raspberry	_Pi/Co	de/Clier	nt 🛩	^ X

The control mode of client on Linux is the same as that of Windows, but it does not have the function of face detection and tracking.

If the image is not clear, please check whether the camera protective film is torn off.

Trouble shooting

If the car works abnormally, it may be caused by following reasons: raspberry pi system is stuck or batteries have no power.

You need check batteries power indicator or recharge batteries. Make sure batteries have enough power. When the batteries voltage is less than 7V, the buzzer will make regular sound.

If the batteries are OK, raspberry pi system is stuck. You need wait some time to check if the client works. Or reopen the server and client.

The latest Raspberry Pi official system is not stable. It occasionally is stuck. The old version is more stable.

If the raspberry pi system is stuck for a long time, you need reboot raspberry pi.

If you have any concerns, please feel free to contact us with pictures:

support@freenove.com

Android and iOS app

You can download and install the Freenove Android app from below: On Google play:

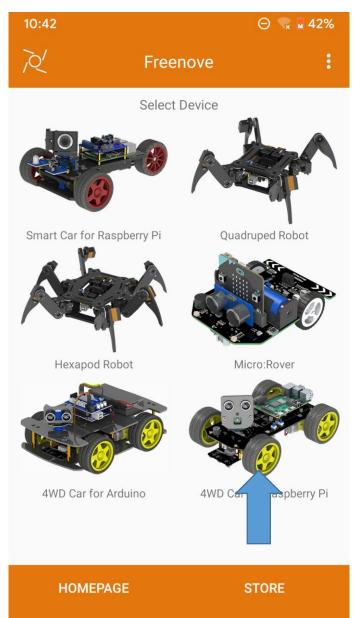

https://play.google.com/store/apps/details?id=com.freenove.suhayl.Freenovez On GitHub:

https://github.com/Freenove/Freenove_App_for_Android

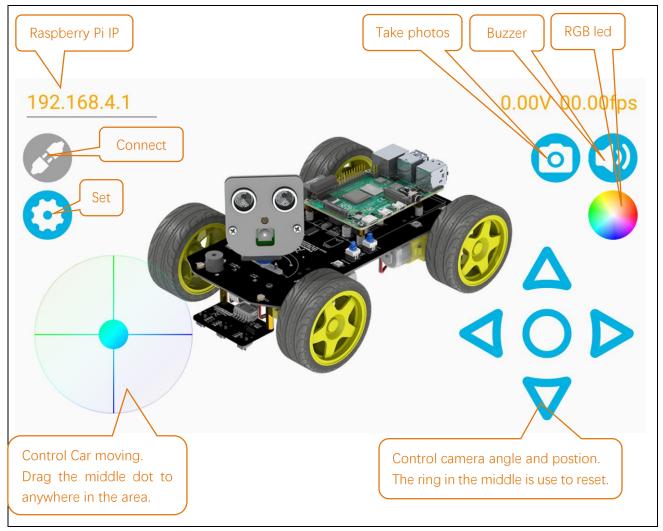

In this github repository, you can find the App instruction (Tutorial.pdf).

You can download and install the Freenove iPhone ios app by searching freenove in app store.

Open the app and select the car.

Open the server in Raspberry Pi car first. And enter your Pi IP.

Free innovation

If you have any concerns, please feel free to contact us via support@freenove.com

If you want to write your own program to control the car, just follow this section. We will teach you how to program this car.

If you have never learned python before, you can learn some basic knowledge via the link below: https://python.swaroopch.com/basics.html

First, turned on S1 and S2. Then open Raspberry Pi, right click and create a new folder on the desktop: Test

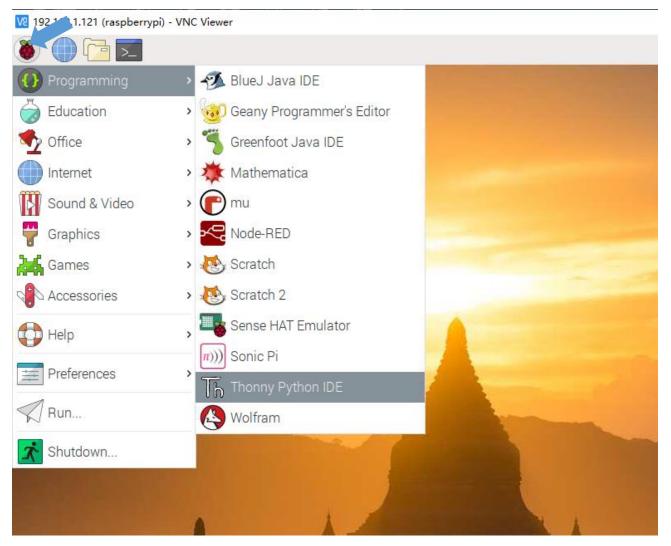

Open Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server in your Raspberry Pi and copy the following **8 files** into the Test folder we created.

	Server	~ ^ X
File Edit View Sort Go Tools		
	/home/pi/Freenove_4WD_Smart_Car_Kit_for_Raspberry_Pi/Code/Server	-

Note: the code and library are written by Python 3. You need execute the code with python 3.

Open the terminal and use the following command to enter the directory where test_Code.py is located:

cd ~/Desktop/Test

Run test_Code.py:

sudo python test_Code.py

			pi@raspberrypi: ~/Desktop/Test	~	^	×
File	Edit	Tabs	Help			
			\$ cd ~/Desktop/Test / <mark>Desktop/Test \$</mark> sudo python test_Code.py			

Code example

Following are code example for the parts. For more detail, please refer to <u>Module test section</u>. For more details, please refer to <u>Motor</u>.

1	from Motor import *	#import Motor
2	PWM=Motor()	#create an object
3	PWM. setMotorModel(2000, 2000, 2000, 2000)	#Forward
4	time.sleep(3)	#waiting 3 second
5	PWM.setMotorMode1(0,0,0,0)	#Stop

ADC. For more details, please refer to ADC.

1	<pre>from ADC import *</pre>	#import ADC
2	adc=Adc()	#create an object
3	Left_IDR=adc.recvADC(0)	#get value
4	<pre>print ("The photoresistor voltage on the left is "+str(Left_IDR)+"V")</pre>	

LED. For more details, please refer to <u>LED</u>.

1	from Led import *	#import Led
2	led=Led()	#create an object
3	led.ledIndex(0x04,255,255,0)	#yellow
4	led. ledIndex (0x80, 0, 255, 0)	#green
5	time.sleep(5)	#wait 5s
6	<pre>led.colorWipe(led.strip, Color(0,0,0))</pre>	#turn off

Buzzer. For more details, please refer to <u>Buzzer</u>.

	· · · · · · · · · · · · · · · · · · ·	
1	<pre>from Buzzer import *</pre>	#import Led
2	from Command import COMMAND as cmd	#import Led
3	buzzer=Buzzer()	#create an object
4	buzzer.run('1') #Start	
5	time.sleep(3)	#wait 3s
6	buzzer.run('0') #Stop	

Servo. For more details, please refer to Servo.

1	<pre>from servo import * #import Led</pre>	
2	pwm = Servo() #create an object	
3	#Servo rotates from 30 degrees to 150 degrees	
4	for i in range(30, 150, 1) :	
5	pwm.setServoPwm('0', i)	
6	time.sleep(0.01)	
7	#Servo rotates from 150 degrees to 0 degrees	
8	for i in range(150, 30, -1) :	
9	pwm.setServoPwm('0', i)	
10	time.sleep(0.01)	

Ultrasonic module. For more details, please refer to <u>Ultrasonic module</u>.

1	<pre>from Ultrasonic import *</pre>	#import Led
2	ultrasonic=Ultrasonic()	#create an object
3	<pre>data=ultrasonic.get_distance()</pre>	#Get the value
4	<pre>print ("Obstacle distance is "+str(data)+"CM")</pre>	

These codes can be integrated into one code to achieve your requirement.

What's next?

Thanks for your reading.

This book is all over here. If you find any mistakes, missions or you have other ideas and questions about contents of this book or the kit and ect., please feel free to contact us, and we will check and correct it as soon as possible.

After completing the contents in this book, you can try to reform this smart car, such as purchasing and installing other Freenove electronic modules, or improving the code to achieve different functions. We will also try our best to add more new functions and update the code on our github (<u>https://github.com/freenove</u>).

If you want to learn more about Arduino, Raspberry Pi, smart cars, robots and orther interesting products in science and technology, please continue to focus on our website. We will continue to launch cost-effective, innovative and exciting products.

www.freenove.com

Thank you again for choosing Freenove products.
